CATERPILLAR PERFORMANCE HANDBOOK

a publication by Caterpillar, Peoria, Illinois, U.S.A.

2019

Performance information in this booklet is intended for estimating purposes only. Because of the many variables peculiar to individual jobs (including material characteristics, operator efficiency, underfoot conditions, altitude, etc.), neither Caterpillar nor its dealers warrant that the machines described will perform as estimated.

NOTE: Always refer to the appropriate Operation and Maintenance Manual for specific product information.

Materials and specifications are subject to change without notice.

CAT, CATERPILLAR, LET'S DOTHE WORK, their respective logos, "Caterpillar Yellow," the "Power Edge" and Cat "Modern Hex" trade dress as well as corporate and product identity used herein, are trademarks of Caterpillar and may not be used without permission.

PREFACE

Machine performance must ultimately be measured in unit cost of material moved, a measure that includes both production and costs. Factors bearing directly on productivity include such things as weight to horsepower ratio, capacity, type of transmission, speeds and operating costs. The Performance Handbook considers these factors in detail. There are other less direct machine performance factors for which no tables, charts or graphs are possible. Serviceability, parts availability and operator convenience are examples. In comparing machine performance, all factors should be considered. This Handbook is intended as an aid which, when coupled with experience and a good knowledge of local conditions, can assist in estimating true machine performance.

Many sections of the Handbook include tables or curves showing cycle times or hourly production figures for Cat® machines under certain conditions. Statements of conditions always accompany or precede the curves or tables. Before using any performance information in this Handbook, a complete understanding of the qualifying conditions is essential. The data is based on field testing, computer analysis, laboratory research and experience; and every effort has been made to assure their correctness.

However, all such data is based upon 100% efficiency in operation — a status which cannot be achieved continuously even under ideal conditions. Thus, in using such performance and production data, it is necessary to correct the results indicated in the handbook tables by appropriate factors. This allows for the anticipated actual job efficiency, operator efficiency, material characteristics, haul road conditions, altitude and other factors which may reduce performance or production on a particular job.

Methods for estimating machine owning and operating costs vary widely, depending on locality, industry practices, owner preferences and other factors. One method is suggested in the Handbook section on Owning and Operating Costs. When used with good judgment, it has provided reasonably accurate estimates in the past. Included in the Owning and Operating Section are guidelines, based on working conditions, to assist in estimating consumption of fuel and lubricants, tire life and repair costs for Cat machines. However, what one Handbook user regards as “excellent” conditions, another may consider “severe” or “average”, depending on his own experience and basis of comparison. Therefore, these guidelines should be considered only approximations.

Caterpillar has made every effort to assure that the information contained in this Handbook is accurate and is a fair statement of the results to be achieved in the circumstances indicated. However, because of the many variables involved in estimating the production or performance of earthmoving machinery, their consumption of fuel and lubricants, tire life and repair costs, and the possibility of inadvertent errors or omissions in assembling this data, Caterpillar cannot and does not imply that all data in this book are complete nor that this level of performance will be achieved on a given job.

Specifications shown in this Handbook were current at time of printing. However, due to Caterpillar's many machine improvement programs, specifications and materials may change without notice. For current specifications relating to a machine's performance, please refer to the most recent Cat product specification sheet.

Caterpillar

ENVIRONMENT AND SUSTAINABILITY

Caterpillar supports environmental responsibility through sustainable development. Our products and services are intended to support sustainable development of global resources and they will meet or exceed applicable regulations and standards wherever they are initially sold. We establish and adhere to environmentally sound policies and practices in product design, engineering, and manufacturing. We educate and encourage

our customers to use the products they purchase from us in environmentally responsible ways. We take effective steps to continually increase the natural resources efficiency and cleanliness of our facilities. When available, the various product groups have included relevant sustainability data with their content updates for inclusion in the Performance Handbook.

OPERATOR AND MACHINE PROTECTION

A well trained operator, working under suitable conditions, utilizing a modern, properly-equipped machine provides a machine-operator team capable of giving maximum production. These factors, along with appropriate job site rules and communication procedures, are essential to coordinate people and machines working together.

Appropriately protected and maintained machines are less likely to suffer premature component failure or damage, and give operators the confidence and assurance they need to carry out their work. Furthermore, training is not complete until the operator reads, understands and agrees to follow the instructions provided in the Operation and Maintenance Manual included with every Cat machine.

Employers have a duty to provide a safe work place for their employees. The purchaser of a Cat machine has a duty to review his/her particular application and job site for the machine to identify potential hazards inherent to that application or job site. Based on the results of this hazard analysis, the appropriate operator and machine protection configuration can be determined.

Caterpillar designs, builds, and tests its products to ensure the safety of operators, maintenance persons, service persons, and bystanders. That means people in, on and around Cat products. Caterpillar provides as standard equipment the appropriate operator and machine protection for most applications. However, particular applications, including the use of some Work Tools, may require additional operator and/or machine protection. Caterpillar offers related options for most such applications. However, there may be very special applications where the Cat dealer or the Purchaser may want to fabricate, or request Caterpillar to provide, custom or special guarding. Your Cat dealer can help you with this hazard analysis and guarding configuration process.

I. Operator Training and Protection Practices

Remember that any kind of machine or mechanical device can be hazardous if not kept in good condition, or if operated by careless or improperly trained operators, or if operated in an irresponsible manner.

Listed below are some recommended basic steps that can be broadly applied to most work environments:

- Train operators for the job they are assigned to do. The length and type of training must comply with governmental and local regulations wherever they apply. As an example, machine operators in mining activities must be trained in accordance with Mine Safety and Health Administration (MSHA) regulations. Where specific regulations do not apply, no operator should be assigned to a job until he or she meets the following minimum requirements:
 - Completes proper training to operate the assigned machine and understands that seat belts must be worn whenever seated in operator's compartment. **SEAT BELTS SAVE LIVES!**
 - Reads and understands the Operation & Maintenance manual for that machine, and knows that a copy of that manual is stored in the operator's compartment.
 - Reads and understands the AEM (Association of Equipment Manufacturers) Safety Manual, or any other furnished manual related to rules for safe machine operation and identification of hazards. For example, that includes the Work Tool Operation and Maintenance Manual if a Cat Work Tool is involved in the given application.
 - Has appropriate personal protective equipment and knows how to use it. This includes such things as hard hat, gloves, safety glasses, hearing protection, high-visibility vest, and safety shoes.
 - Knows what the job requirements are, what other machines are working in the area, and is aware of any hazardous conditions that may arise.

- Be sure operators are alert and in proper physical and mental condition to perform their work assignments safely. No machine should be operated by a person who is drowsy, under the affect of medicines or drugs, suffers blackouts, or is suffering from any physical or mental distraction that could contribute to unsafe operation.
- Maintain proper job conditions and working procedures. Check the job for possible hazards, both above and below ground level. Look for all possible sources of danger to the operator and others in the area. When operating in hazardous conditions the door and windows must always be closed. Pay particular attention to conditions which may be hazardous or near the operating limits of the machine: e.g., side slopes, steep grades, potential overloads, etc. Examine the work site for restricted traffic patterns, obstructed views, congestion, underground power or gas lines, etc. If the machine is equipped with a Quick Coupler, always make sure the Work Tool is properly attached by conducting an attachment test as directed in the Quick Coupler or Machine Operation and Maintenance Manual. Hazardous work conditions should be corrected wherever possible and adequate warnings should be posted when applicable.
- Provide the correct machine to handle the job and equip it properly for the job to provide the necessary operator protection. Check for compliance with all applicable governmental and local regulations. It is the legal responsibility of the machine owner or employer to see that his equipment complies with, and is operated in accordance with, all such requirements.
- Make sure the machine is properly maintained. The operator at the beginning of each shift should perform a walk-around inspection before the machine is placed in operation. This process is described in the machine and Work Tool Operation and Maintenance Manual. If this inspection reveals any problems that could affect safety, the machine or Work Tool must not be operated until these problems are corrected. Some examples include:
 - Loose, bent or missing grab irons, railings or steps;
 - Worn, cut or missing seat belts (any seat belt over three (3) years old must be replaced regardless of condition);
 - Damaged windows in the operator's compartment;
 - Worn, rubbing or abraded electrical insulation and hydraulic hoses;
 - Material or unwanted debris accumulation;
 - Incompatibility of the component attachments (Quick Couplers);
 - Hydraulic leaks that could impair the lock/secure feature of a Quick Coupler or other securing devices;
 - Any fluid leaks; and
 - Missing or damaged guards.
- Know the limits of your machine and equipment. With certain Work Tool combinations, including Quick Couplers, the Work Tool can hit the cab or the machine. Always check for interference limits when first operating.
- It is the machine owner's or employer's responsibility to ensure the machine is properly maintained. Your Cat dealer will be glad to assist you in selecting and equipping the machine best suited for your job and in providing maintenance for your machines.

II. Machine Modifications

Modifications must not be made to the machine that:

- Interfere with operator visibility;
- Interfere with ingress or egress from the machine;
- Exceed the rated payload or gross combination weight of the machine resulting in overloading the braking and/or steering system or the roll-over protective structure (ROPS) capacity rating (shown on a plate affixed to the ROPS); or
- Place objects in the cab that intrude into the operator's space or that are not firmly fixed into place.
- Are not authorized by Caterpillar.

III. Operator-related Equipment Options

Each job presents unique conditions that must be taken into account. Consider direct dangers to the operator as well as all possible sources of distraction that could reduce operator efficiency and increase the chances of costly and dangerous mistakes. Climate-controlled, sound-suppressed cabs, and special exterior lighting are options available from Caterpillar that can address requirements of special working environments.

“Flexible” machines include hydraulic excavators (track-type, wheel-type, and compact), skid-steer loaders, backhoe loaders and integrated tool-carriers can utilize interchangeable “Work Tools” to accomplish specific tasks. Work Tools or any tool used in hazardous applications like demolition, quarry, logging, stump grinding, scrap handling, milling, and scaling, can create a need for special operator guarding. When flying debris from impact, cutting, shearing or sweeping attachments is present, additional protective devices such as a front screen, Falling Object Guarding System (FOGS, includes top & front guarding), thick polycarbonate windshields or a combination of these is recommended by Caterpillar. The failure to provide proper operator/machine guarding in some of these applications can lead to machine damage, personal injury or death. Contact your Cat dealer for operator guarding options on your machine.

IV. Machine Protection

Check the job for unusually demanding conditions that could cause premature failure or excessive wear of machine components. Additional protective devices such as heavy-duty radiator guards, crankcase guards, engine enclosures, track roller guards and/or brake shields may be needed. Also, consider the use of anti-vandalism devices, such as cap locks and instrument panel guards. The failure to provide proper guarding in some of these applications may lead to machine damage, personal injury or death. Contact your Cat dealer for machine-protection and vandalism-prevention options for your machine.

V. Fire Prevention

Remember that most fluids on your machine are flammable!

To minimize the risk of fire, Caterpillar recommends following these basic steps:

- Always perform the Walk-Around Inspection described in Part I. It can identify many of the fire hazards described below.
- Remove trash (leaves, twigs, papers, etc.) that may accumulate in the engine compartment or around other hot parts on the product.
- Do not operate a machine if leakage of flammable fluids is noticed. Repair leaks before resuming machine operation. Most fluids used in Cat machines should be considered flammable.
- Keep access doors to major machine compartments in working order to permit the use of fire fighting equipment, should a fire occur.
- Avoid attaching electrical wiring to hoses and tubes that contain flammable or combustible fluids. Hydraulic hoses can move during machine operation and abrade wires and other hoses if improperly secured.
- Replace any rubbing, damaged, frayed, kinked or leaking hydraulic hoses or fittings. Use genuine Cat parts or their equivalent, including both pressure and temperature limit capabilities.
- Follow safe fueling practices as described in Cat Operation and Maintenance Manuals, AEM Safety Manuals, and local regulations. Never store flammable fluids in the machine operator's compartment, nor smoke while fueling the machine.
- As an additional safety measure, keep a fire extinguisher on the machine in a location as specified in the Operation and Maintenance Manual.
- Consider installation of an after-market fire-suppression system (FSS) on the equipment if the application and working conditions warrant it.

VI. Safety Regulations

Regulations vary from country to country and often within country. Your Cat dealer can assist you in properly equipping your machine to meet applicable requirements. **Note: The general summaries given below are not substitutes for Owners or Employers reading and being familiar with the appropriate local laws.**

(a) United States (US)

With a few exceptions, all machine operations in the United States are covered by federal and/or state regulations. If the machine is used in mining activities, the regulations are administered by the Mine Safety and Health Administration (MSHA). Other activities, including construction, are under regulations administered by the Occupational Safety and Health Administration (OSHA). These agencies require employers to provide a safe working environment for employees. Caterpillar has the same objective.

OSHA and MSHA have adopted criteria for ROPS, Falling Object Protective Structures (FOPS), seat belts, warning horns, back-up alarms, operator sound levels, steering systems, and braking systems. Additional operator's compartment protection may be required for machines engaged in logging, demolition and other special applications.

(b) European Union (EU)

The EU Machinery Safety Directive applies to Cat machines and most work tools. It requires that the "CE mark" be applied to the product and that a manufacturer's declaration be provided. The "CE mark" indicates that safety issues have been addressed by applying the appropriate safety standards in the design and manufacture of the machine. The objective of the Safety Directive is to protect operators, spectators and maintenance personnel. Caterpillar fully supports this objective.

VII. Sound Suppression

Different marketing areas have different noise emission requirements. Noise regulations usually specify limits for operators and spectators.

(a) United States

OSHA and MSHA noise-control regulations set permissible noise-exposure limits for machine operators and employees. Operator protection from machine noise can be achieved by use of factory-built cabs as offered in the Caterpillar Price List. These cabs, when properly maintained and operated with the doors and windows closed, reduce the operator sound level for an eight-hour operating period to meet the OSHA and MSHA noise-exposure limits in effect at the date of manufacture. Variables that may be encountered on the job site, such as other nearby noise sources or noise-reflecting surfaces, may reduce the allowable work hours. If this occurs, hearing protection may be required. This is especially true if a machine is not equipped with a closed cab. For example if the machine has no cab, or is being operated with the doors or windows opened.

(b) European Union

Operator sound-exposure requirements for machines in Europe are very similar to the OSHA and MSHA regulations mentioned above. In addition to operator sound-exposure requirements, most types of Cat machines are subject to European Commission regulations for exterior sound levels. Caterpillar ensures its products sold in the EU comply with the applicable noise regulations.

VIII. Replacement Parts for your Cat Machine

WARNING

When replacement parts are required for this product, Caterpillar recommends using Cat replacement parts or parts with equivalent specifications including, but not limited to, physical dimensions, type, strength and material. Failure to heed this warning can lead to premature failures, product damage, personal injury or death of persons on, or around, the product.

Features:

- **Cat® engines with ACERT™ Technology** meet U.S. EPA Tier 4 Final/EU Stage IV/Japan 2014 (Tier 4 Final), or Tier 2/Stage II/Japan 2001 (Tier 2) equivalent emission standards. The four core elements of meeting these standards are:
 - I) Common Rail;
 - II) Electronics, ADEM™ A4;
 - III) Fuel delivery, Mechanical-activated Electronic Unit Injection (MEUI™ A-C);
 - IV) Air Management, Wastegate Turbocharging, Air to Air Aftercooling (ATAAC) with the proven technology of a crossflow cylinder head.
- **Cat electronically controlled transmissions** ... Transmissions purpose built and designed for articulated trucks and their applications. Advanced Productivity Electronic Control Strategy (APECS) delivering smooth shifting transmissions with improved acceleration and high productivity. Providing complete integration with the engines for efficient power delivery as well as offering advanced diagnostic and troubleshooting capabilities.

- **Articulating and fully oscillating hitch** ... Links front and rear frames for exceptional maneuverability and traction on uneven terrain while eliminating damaging twisting of the frames. Bolted hitch design allows optimum material choices for the cast hitch head and the hard-wearing tube. Bolted design allows easier rebuild and repair.
- **Three-point front suspension** ... Three-point front suspension with long-stroke, low-pressure suspension cylinders provide unparalleled ride quality for operator comfort and higher average haul speeds. Front and rear suspension together with the hitch provide for excellent traction in all conditions.
- **Wide, long and low dump body design** ... For excellent loadability and high fill factors, excellent machine stability and load retention as well as a good match for other Cat loading systems. Diverging flow design also gives excellent material ejection.
- **Standard ROPS/FOPS, low sound level cab** ... Two man cab common across the range. Large cab with excellent visibility, ergonomic control layout and plentiful storage.
- **High capacity low pressure tires in single formation** ... For superior traction and flotation in poor underfoot conditions.
- **Bare Chassis offerings** ... For certain applications the Caterpillar OEM Solutions Group offers non-dumper/Bare Chassis arrangements.

Bare Chassis arrangements applications could include: water, service (fuel and lube), high capacity body (waste, coal, etc.), open body (log, pipe, etc.), container carrier, hook lift, tow, cable reel, etc. Please refer to specific OEM for additional information.

Use of Ground Pressure Charts

Articulated trucks are normally equipped with wide base radial tires, for improved flotation in poor underfoot conditions. Ground pressure is a function of tire deflection and is also affected by tire penetration. The charts in this section provide a means to estimate ground pressure for 0 and 76 mm (3") tire penetration, when gross vehicle weight, axle load distribution and tire inflation pressure are known. The ground pressure charts on the following pages are based on Michelin XADN tire characteristics. Results may differ for other tread patterns.

Tire load can be calculated by the following formula:

$$\text{Tire Load} = \frac{\text{Heaviest Axle Load}}{2}$$

Example

Find the ground pressure generated by a 725C fully loaded with zero and 76 mm (3") tire penetration. The machine is equipped with standard Michelin 23.5R25 tires, inflated to the recommended pressure.

$$725C \text{ Tire Load} = \frac{46\,820 \text{ kg} \times 0.34}{2} = 7959 \text{ kg}$$

$$725C \text{ Tire Load} = \frac{103,220 \text{ lb} \times 0.34}{2} = 17,547 \text{ lb}$$

From the tire section in this book, inflation pressure for the 725C is 325 kPa = 3.25 bar (47 psi).

From the ground pressure chart for 23.5R25 tires, Ground pressure = 3.1 kg/cm² (44 psi) with zero tire penetration.

Ground pressure = 1.4 kg/cm² (21 psi) with 76 mm (3") tire penetration.

See the Wheel Tractor Scraper section for explanation on using:

- Rimpull-Speed-Gradeability Curves
- Retarder Curves

See Mining & Off-Highway Trucks section for Fixed Times for Hauling Units.

Features:

- **Center pivot backhoe** — 415F2, 416F2, 420F2, 430F2, 450F.
- **Side shift backhoe** — 422F2, 427F2, 428F2, 432F2, 434F2, 444F2.
- **Single-tilt loader** features a narrow loader tower and single bucket tilt cylinder for improved visibility.
- **Integrated toolcarrier (parallel lift) loader** offers maximum lift and breakout forces and parallel lift for efficient loading and material handling.
 - **Hydraulic Quick Coupler** provides versatility and allows quick connection to selected work tools for the Cat family of integrated toolcarriers.
- **Excavator-style backhoe** provides enhanced visibility even with narrow buckets, ability to reach over obstacles, and faster, easier truck loading.
 - **Backhoe Quick Coupler** offerings include a convenient “pin grabber” and versatile “pin puller” for use with D/E/F Series and competitive work tools.
- **Load-sensing hydraulic system** provides full hydraulic torque to implements at all engine speeds, low fuel consumption, smooth control and low lever efforts. An electronic torque limiter automatically optimizes hydraulics.

For product support, sales and marketing support information and business tools to help improve business functions and processes for Cat® dealers, click on the link below. For Backhoe Loaders and other Cat machines select Machines under the Product tab.

dealer.cat.com

- **Pilot operated backhoe controls** provide smooth, efficient operation and operator comfort. Not available on 422F2, 427F2, 428F2, 434F2. New thumb roller controllers provide ergonomic function of the extendible stick and/or auxiliary hydraulic circuits. Convenient pattern changer switch is within the cab.
- **Pilot operated stabilizer controls** are standard on 420F2, 430F2, 432F2, 444F2, 450F. Auto-up stabilizers are standard with the deluxe cab.
- **The Cat C3.4 and C4.4 ACERT™ Direct Injection Turbocharged Aftercooled engines** meet U.S. EPA Tier 4 Final/EU Stage IV/Japan 2014 (Tier 4 Final) emission standards. The efficient fuel system delivers reliable engine lug performance. Some models are powered with Cat 3054C DIT engines, which meet Tier 2/Stage II/Japan 2001 (Tier 2) equivalent emission standards.
- **XT™-3 ES hoses** combined with Cat couplings and O-ring face seal fittings provide a dry, reliable machine. The F and F2 Series backhoe circuits incorporate the XT-3 ES ToughGuard™ hoses.
- **Operator station features:** Air-suspension seat is standard on all models. Adjustable tilt steering is standard except on 415F2, 416F2, 422F2. Rear, door and side windows can be fully opened for enhanced ventilation and cab roof is extended to help keep operator dry. Four-post Rollover Protective Structure (ROPS) for increased protection. Fully featured, a Deluxe Cab option will feature pilot operated joystick controls, state-of-the-art control panels with white-faced gauges mounted in a rotating vandal cover, pilot operated stabilizer controls with automatic hold upon lifting, and additional system monitoring including service indicators for engine air cleaner, water-in-fuel, and hydraulic filter.
- **High performance backhoe linkage** offers 205° of bucket rotation with one pin position. Backhoe geometry creates more stick force than previous series, brought closer to the operator to pull spoil through trench. The 450F has a backhoe bucket rotation of 198°.
- **Diagonal Retention System (DRS)** standard on all factory installed buckets with weld-on tooth adapters, excluding the 450F. Bucket teeth are attached with diagonal pins rather than horizontal pins for easy exchange of bucket teeth. 450F buckets remain fitted with J225 size, horizontal fastener pins. All other buckets have bolt-on Uni-teeth.
- **Integrated lift eye** on backhoe linkage. Object handling installation available on 427F2, 428F2, 432F2, 434F2, 444F2 for EU countries.
- **Cat Cushion Swing** system smooths the swing function, improving the return-to-trench controllability.
- **The extendible stick** on 415F2, 416F2, 420F2, 430F2 and 450F offers object clamping while extending. Ser-rated edges secure clamped objects. Wear pad configuration eases adjustment on all four sliding surfaces. Center pivot sticks have thumb mounts.
- **The hydraulic system** uses load sensing, flow sharing valves with anti-drift characteristics. Smooth, multi-function operation with the ability to have maximum lifting and digging forces at any RPM.
- **Ride Control** available as an option on all F and F2 Series machines. The Ride-Control system smooths the ride under all job-site conditions.
- **4F/4R fully synchronized gear box** provides on-the-go shifting in all gears and on-the-go engagement of optional all wheel drive. Maximum travel speed is 40 km/h (25 mph).
- **Auto-Shift transmission** is available as an option on F2 Series and is standard on 444F2 and 450F for operator comfort and efficiency. This transmission is equipped with 6F/3R power shift gear box.
- **Lock-up torque converter** available as an option on 420F2, 430F2, 428F2, 434F2, 434F2 and 444F2 for improved efficiency.
- **Brakes** are oil immersed, multi-disc, self adjusting, and wear surface is made of Kevlar for long service life. Brakes are boosted on all models.
- **All Wheel Drive** is available as an option on all F and F2 Series machines, standard on 430F2, 434F2, 444F2 and 450F. It improves mobility and loader performance in poor traction conditions and can be engaged at any time in any operating condition. Includes 4-wheel braking effect feature.
- **Sloping, flip-open multi-access hood** allows excellent visibility to the loader working area and tilts forward for single location access to all daily service points.
- **Dry-type, radial seal air cleaner** with automatic, integrated dust ejector system provides efficient pre-separation. The two-stage air filter incorporates both air cleaner and pre-cleaner functions into a single unit mounted under the hood.

Material-Handling Arm Position	1058 kg	2333 lb	674 kg	1487 lb	495 kg	1092 lb
Operating load (SAE J1197 and CEN 474-4)	8867 mm	29'1"	9864 mm	32'4"	10 864 mm	35'8"
Overall length, maximum						

Operating load is hydraulic and tip limited.

Dimensions and performance specifications shown are for 4WD machines equipped with 12.5/80-18 I-3 front tires, 19.5L-24 R-4 ATU rear tires, ROPS canopy, standard stick with 610 mm (24 in) standard duty bucket, and 0.96 m³ (1.25 yd³) loader bucket and standard equipment unless otherwise specified.

Measured from nose of machine.

KEY

- A — Boom lift kg lb
- B — Stick lift kg lb

Standard Stick

Extendible Stick — Retracted

Extendible Stick — Extended

Lift capacities are over-end values per SAE J31; machine equipped with 4WD, OROPS, 1.3 m³ (1.7 yd³) general-purpose loader bucket, 610 mm (24 in) heavy duty backhoe bucket and 985 kg (2200 lb) counterweight.

*Indicates lift capacity is stability limited.

Work tools for Cat backhoe loaders are divided into two groups.
For technical questions relating to all work tools inside the U.S.: (800) 282-5384.
Europe, Africa, Middle East: 31 73 63 996 00.

- **Caterpillar Factory Work Tools:** Cat work tools installed on machines or shipped separately from Caterpillar Distribution Services. Includes the most popular work tools such as buckets, forks and material-handling arms. *Order from Machine Orders Division.*
- **Caterpillar Work Tools America Asia Pacific (AAP):** Cat work tools specifically designed for the Cat backhoe loader by the Caterpillar Work Tool division. *Orders inside U.S.: (800) 255-2372. Outside U.S.: 00 1 (785) 456-2224.*

Loader Work Tools	Auxiliary Hydraulics required
1. IT Angle Blade	Multi-Purpose Hydraulics included with IT not required
2. IT Asphalt Cutter	not required
3. IT Bale Spear	Multi-Purpose Hydraulics included with IT not required
4. IT Broom: Angle and Pick-up*	Multi-Purpose Hydraulics included with IT not required
5. IT Bucket, General Purpose	Multi-Purpose Hydraulics included with IT
6. IT Bucket, Multi-Purpose	Multi-Purpose Hydraulics included with IT
7. IT Bucket, Side-Dump	not required
8. IT Forks, Pallet	not required
9. IT Material Handling Arm	not required
10. IT Rake	not required
11. Quick Coupler, IT Hydraulic	Multi-Purpose Hydraulics not required
12. Single Tilt Bucket, General Purpose	Multi-Purpose Hydraulics includes coupling hydraulics only; can add Multi-Purpose Hydraulics
13. Single Tilt Bucket, Multi-Purpose with or without Fold-Over Forks	
14. Single Tilt Hydraulic Quick Coupler	

*Requires the IT Auxiliary Attachments Control (electrical wiring harness).

Backhoe Work Tools	Auxiliary Hydraulics required
1. Auger	Combined Function Hydraulics not required
2. Bucket, Cemetery	not required
3. Bucket, Coral	not required
4. Bucket, Ditch Cleaning	not required
5. Bucket, Extreme Service	not required
6. Bucket, Heavy Duty	not required
7. Bucket, Heavy Duty Rock	not required
8. Bucket, High Capacity	not required
9. Bucket, Soil Excavation	not required
10. Bucket, Standard Duty	not required
11. Compactor, Vibratory Plate	One Way or Combined Function Hydraulics
12. Hammer, Hydraulic	One Way or Combined Function Hydraulics
13. Quick Coupler, Mechanical Pin-Puller for Cat or Case tools	not required
14. Quick Coupler, Mechanical Pin-Grabber	not required
15. Quick Coupler, Mechanical Pin-Puller for Cat or Deere tools	not required
16. Quick Coupler, Pin Lock	not required
17. Quick Coupler, Side-Tilting Pin Lock	Combined Function Hydraulics
18. Ripper	not required
19. Thumb, Hydraulic	Combined Function Hydraulics
20. Thumb, Mechanical	not required

PRODUCT LINE DESCRIPTION

Cat® Rotary Drills are available with a maximum bit load range of up to 63 975 kg (141,000 lb), to suit a wide variety of applications. They’re proven to deliver efficiency, high productivity and low cost, as well as provide a comfortable environment for the operator.

A synergy of robust structures, long-lasting systems and innovative technology, the Cat line of rotary drills have demonstrated their effectiveness and longevity in a variety of mining environments, including both soft- and hard-rock applications, as well as extreme temperature and high-altitude locations.

Equipped to power rotary tricone bits of various sizes and configurations, the diesel powered drills can be configured with high pressure compressors for DTH (down-the-hole) hammer drilling. Caterpillar has the drill that delivers the optimal combination of bit load, rotary torque and onboard air to ensure maximum productivity in a wide range of applications.

PRIMARY APPLICATIONS FOR ROTARY BLASTHOLE DRILLS

MODEL	Bench Drilling	Cast Blast Drilling	Presplit Drilling	Grade Control Drilling	Over Burden Drilling
MD6200*	x		x	x	x
MD6250	x	x	x	x	x
MD6310	x	x	x	x	x
MD6380	x	x	x		x
MD6640	x	x			x

*Primary production blasthole drill, with the ability to do limited presplit drilling.

CAT ROTARY DRILL FEATURES

Solid Structures

Box section frame rail construction with optimized, profiled transitions in all high stress areas provides exceptional structural durability. Caterpillar undercarriages with three-point oscillating suspension, GLT (grease lubricated tracks, double post upper carrier rollers).

Sturdy Mast

Each model can be configured with various mast lengths to suit specific application requirements for single pass or multi pass drilling.

Designed with double-cut lacing in all joints to assure long life, mast structures are made of rectangular ASTM 500 Grade B steel tubing for all main chords, cross members and lacing.

This design ensures a torsionally strong mast structure and reduces deflection and material fatigue.

Machined frame/mast interfaces eliminate custom fitment and allow for easy mast replacement or swapping of masts between drills without cutting or welding.

Jack System

Jack casing assemblies are integrally welded to the main frame providing structural strength and durability and reduce torsional flexing of the main frame.

The leveling jacks are positioned to provide excellent stability and weight over the hole.

HOBO Wrench

The variable grip Hydraulically Operated Break Out wrench is part of a highly efficient breakout system that increases speed of pipe changing operations, consequently increasing productivity.

The hydraulic break out wrench is operated from the cab thus protecting the operator.

It also reduces impact loading to the mast and rotary head during pipe changes, further increasing drill mechanical availability.

Power Group

Fast cycle times are achieved through top of class bit load, rotary head horsepower, bailing air and a multitude of time-saving systems for maximum efficiency.

Ergonomic Cab

Cab rubber shock-mounts absorb mechanical vibration and restrict exterior noise. The operator station design integrates an ergonomic seat, joystick controls with full instrumentation, and dual 254 mm (10 in) color displays, high definition touchscreen and 12 volt power port. There is an additional display screen for cc cameras which is color, high-definition and 254 mm (10 in).

NOTE: For specific emission standards per model and rating, please see pages 4-21 through 4-22.

DESIGN DATA***Diesel Engines**

Bearings — Precision-type steel-backed aluminum alloy with lead-tin overlay copper bonded to bearing surface. High load carrying ability and exceptional fatigue strength.

Block — Cast from high tensile strength grey iron. Internal ribbing provides added strength.

Cooling — Built-in, gear driven centrifugal pump circulates jacket water through engine at all times. Water temperature is thermostatically controlled. Heat exchangers and radiators are available.

Crankshaft — Forged steel, dynamically balanced, heat treated and superfinished.

Cylinder Liners — Internal surface induction hardened (1.7 L, 3300, 3400, 3500 and 3600 Families) for excellent wear life. Full-length watercooled for efficient heat transfer.

Fuel System — Adjustment free for reduced engine maintenance, individual fuel injection pumps have built-in calibration — no adjustment required after fuel nozzle replacement (1.7 L, 1.9 L, 3406E, 3456, 3500 and 3600 families have unit injectors). 3126, 3408E and 3412E use the Cat HEUI™ system.

Governor — Hydra-mechanical (Woodward 3161 on 3500 and 3600 Families) for reliability, good response and smooth, stable load changes. Electronically controlled engines use Caterpillar proprietary software and hardware.

Lubrication — Positive displacement gear pump maintains continuous flow of lubricant under pressure to all moving parts. Full-flow filtration is provided by replaceable cellulose filters. Watercooled oil cooler maintains proper oil temperature.

Pistons — Three-ring design (two-ring on 3208) reduces friction, provides excellent oil control, and increases engine efficiency.

Starting — Electric and air starting systems are offered for most models.

Valves — Hardened steel alloy. Valves rotate 3° each time they lift to seat in a new position and allow even heat distribution (except for 3116).

*Except for MaK and CM engines.

Gaseous Fueled Engines

Combustion System — The piston design and compression ratios available provide the ability to utilize a wide variety of gaseous fuels as well as provide low emission output (below 2.0 grams/bhp-hr No_x).

Fuel System — Heavy-duty, industrial-type carburetors designed to maintain optimum air-fuel ratio at all loads and speeds.

Ignition System — Cat Gaseous Fueled Engines employ a low tension magneto, together with an ignition transformer (one at each cylinder), to provide up to 34 kV to spark plugs. The Cat Electronic Ignition system is also available on certain engines.

RATING EXPLANATIONS

All engine ratings listed include such standard accessories as air cleaner and fuel, lube, and jacket water pumps. Power required for auxiliaries such as cooling fans, air compressors, charging alternators, special pumps, etc., must be deducted to arrive at the net power available to drive the load (except as noted). Other ratings are available for specific application and customer requirements, i.e., locomotive, oil field, fire pump, irrigation, etc. Consult your Cat dealer.

Rating Conditions

Performance is based on SAE J1995 standard conditions of 100 kPa (29.61 in Hg) and 25° C (77° F). Performance also applies at ISO 3046-1 (except for Spark Ignited Engines), DIN 6271 and BS 5514 standard conditions of 100 kPa (29.61 in Hg), 27° C (81° F) and 60% relative humidity.

Fuel consumption is based on fuel oil having an LHV of 42 780 kJ/kg (18,390 Btu/lb) and weighing 838.9 g/liter (7.001 lb/U.S. gal). All ratings are based on distillate fuel.

Altitude and Temperature Capabilities

Industrial Diesel Engines — Most intermittent and continuous ratings are applicable to at least 1320 m (5000 ft) elevation without derating. Consult factory for specific applications.

Gaseous Fueled Engines — Ratings for turbocharged and aftercooled engines are generally applicable to 1500 m (5000 ft). Naturally aspirated engines are applicable to 150 m (500 ft).

Diesel Truck Engines — Refer to specification sheets for altitude capability of individual truck engine ratings.

PC – Precombustion Chamber

MEUI – Mechanical Unit Injection

HEUI – Hydraulically Actuated Electronically Controlled

NOTE: Industrial models meet current U.S. EPA Tier 4 Final, EU Stage IIIA, IIIB, or IV emission standards, unless otherwise noted with an *.

Models with an * are available for other global regulated and non-regulated areas.

General definition of engine ratings: ISO 3046-1 — (IACS)
 Meets IMO MARPOL Annex VI NO_x requirements
 Reference Conditions: Air Temperature: 25° C Air Pressure: 1 bar
 Cooling water temperature at charge air cooler inlet: mean 30° C, max. 38° C

*Removal of Cylinder Liner in Transverse Direction.
 **Removal of Cylinder Liner in Longitudinal Direction.
 †MDO only.

Dimensions of engine length for turbocharger at driving end, dimensions for turbocharger at free end on request.

Rating Definitions:

Standby — These ratings are applicable for supplying continuous electrical power (at variable load) in the event of a utility power failure. No overload is permitted on these ratings. Natural gas ratings have been established on natural gas with net calorific Low Heat Value (LHV) of approximately 36.2 mJ/m³ (920 Btu/ft³).

Continuous — Output available without varying load for an unlimited time. Continuous power in accordance with ISO 8528, ISO 3046-1, AS2789, DIN6271, and BS5514. Natural gas ratings have been established on natural gas with net calorific Low Heat Value (LHV) of approximately 36.2 mJ/m³ (920 Btu/ft³).

*Weights and measures depend on generator make/type.

Generator efficiency: 0.96, $\cos \varphi$ 0.8

Specific lubricating oil consumption 0.6 g/kWh, \pm 0.3 g/kWh

LCV = 42 700 kJ/kg, without engine-driven pumps, tolerance 5%

Rating Definitions:

Standby Power Rating — Output available with varying load for the duration of the interruption of the normal source power. Average power output is 70% of the standby power rating. Typical operation is 200 hours per year, with maximum expected usage of 500 hours per year.

Prime Power Rating — Output available with varying load for an unlimited time. Average power output is 70% of the prime power rating. Typical peak demand is 100% of prime rated kW with 10% overload capability for emergency use for a maximum of 1 hour in 12. Overload operation cannot exceed 25 hours per year.

Continuous Power Rating — Output available with non-varying load for an unlimited time. Average power output is 70-100% of the continuous power rating. Typical peak demand is 100% of continuous rated kW for 100% of operating hours.

Applicable Codes and Standards: AS1359, CSACC22.2 No100-04, UL142, UL489, UL869, UL2200, NFPA37, NFPA70, NFPA99, NFPA110, IBC, IEC60034-1, ISO 3046, ISO 8528, NEMA MG 1-22, NEMA MG 1-33, 2006/95/EC for Low Voltage, 2006/42/EC for Machinery, 2004/108/EC.

Fuel rates are based on fuel oil of 35° API [16° C (60° F)] gravity having an LHV of 42 780 kJ/kg (18,390 Btu/lb) when used at 29° C (85° F) and weighing 838.9 g/liter (7,001 lb/U.S. gal). Additional ratings may be available for specific customer requirements, contact your Caterpillar representative for details. For information regarding Low Sulfur fuel and Biodiesel capability, please consult your Cat dealer.

Prime Power Rating — Output available with varying load for an unlimited time. Average power output is 70% of the prime power rating. Typical peak demand is 100% of prime rated kW with 10% overload capability for emergency use for a maximum of 1 hour in 12. Overload operation cannot exceed 25 hours per year.

Continuous Power Rating — Output available with non-varying load for an unlimited time. Average power output is 70-100% of the continuous power rating. Typical peak demand is 100% of continuous rated kW for 100% of operating hours.

Applicable Codes and Standards: AS1359, CSAC22.2 No100-04, UL142, UL489, UL869, UL2200, NFPA37, NFPA70, NFPA99, NFPA110, IBC, IEC60034-1, ISO 3046, ISO 8528, NEMA MG 1-22, NEMA MG 1-33, 2006/95/EC for Low Voltage, 2006/42/EC for Machinery, 2004/108/EC.

Fuel rates are based on fuel oil of 35° API [16° C (60° F)] gravity having an LHV of 42 780 kJ/kg (18,390 Btu/lb) when used at 29° C (85° F) and weighing 838.9 g/liter (7.001 lb/U.S. gal). Additional ratings may be available for specific customer requirements, contact your Caterpillar representative for details. For information regarding Low Sulfur fuel and Biodiesel capability, please consult your Cat dealer.

Rating Conditions:

Diesel Engines — up to 7.1 liter

All rating conditions are based on ISO/TR14396, inlet air standard conditions with a total barometric pressure of 100 kPa (29.5 in Hg), with a vapor pressure of 1 kPa (0.295 in Hg), and 25° C (77° F). Performance measured using fuel to EPA specifications in 40 CFR Part 1065 and EU specifications in Directive 97/68/EC with a density of 0.845-0.850 kg/L @ 15° C (59° F) and fuel inlet temperature 40° C (104° F).

Diesel Engines — greater than 7.1 liter

All rating conditions are based on SAE J1995, inlet air standard conditions of 99 kPa (29.31 in Hg) dry barometer and 25° C (77° F) temperature. Performance measured using a standard fuel with fuel gravity of 35° API having a lower heating value of 42 780 kJ/kg (18,390 btu/lb) when used at 29° C (84.2° F) with a density of 838.9 g/L

Diesel Engine Rating Definitions

Explanation of Ratings A, B, C, D, and E:

- For an exact determination of the appropriate rating, contact your local Cat dealer. Engine rating obtained and presented in accordance with ISO 3046/1.

IND-A (Continuous)

- Continuous heavy-duty service where the engine is operated at maximum power and speed up to 100% of the time without interruption or load cycling.

IND-B

- For service where power and/or speed are cyclic (time at full load not to exceed 80%).

IND-C (Intermittent)

- Intermittent service where maximum power and/or speed are cyclic (time at full load not to exceed 50%).

IND-D

- For service where maximum power is required for periodic overloads (time at full load not to exceed 10% of the duty cycle).

IND-E

- For service where maximum power is required for a short time for initial starting or sudden overload. For emergency service where standard power is unavailable (time at full load not to exceed 5% of the duty cycle).

NA — Naturally Aspirated
 bhp — Brake horsepower
 bkW — Brake kilowatts

*Denotes rating is available in EU and other global regulated and non-regulated areas (Non-U.S.).

—	—	—	—	—	—	—	—	—	90.0	120.7	2200	—	—	—	

Rating Conditions:

Diesel Engines — up to 7.1 liter

All rating conditions are based on ISO/TR14396, inlet air standard conditions with a total barometric pressure of 100 kPa (**29.5 in Hg**), with a vapor pressure of 1 kPa (**0.295 in Hg**), and 25° C (**77° F**). Performance measured using fuel to EPA specifications in 40 CFR Part 1065 and EU specifications in Directive 97/68/EC with a density of 0.845-0.850 kg/L @ 15° C (**59° F**) and fuel inlet temperature 40° C (**104° F**).

Diesel Engines — greater than 7.1 liter

All rating conditions are based on SAE J1995, inlet air standard conditions of 99 kPa (**29.31 in Hg**) dry barometer and 25° C (**77° F**) temperature. Performance measured using a standard fuel with fuel gravity of 35° API having a lower heating value of 42 780 kJ/kg (**18,390 btu/lb**) when used at 29° C (**84.2° F**) with a density of 838.9 g/L.

Diesel Engine Rating Definitions

Explanation of Ratings A, B, C, D, and E:

- For an exact determination of the appropriate rating, contact your local Cat dealer. Engine rating obtained and presented in accordance with ISO 3046/1.

IND-A (Continuous)

- Continuous heavy-duty service where the engine is operated at maximum power and speed up to 100% of the time without interruption or load cycling.

IND-B

- For service where power and/or speed are cyclic (time at full load not to exceed 80%).

IND-C (Intermittent)

- Intermittent service where maximum power and/or speed are cyclic (time at full load not to exceed 50%).

IND-D

- For service where maximum power is required for periodic overloads (time at full load not to exceed 10% of the duty cycle).

IND-E

- For service where maximum power is required for a short time for initial starting or sudden overload. For emergency service where standard power is unavailable (time at full load not to exceed 5% of the duty cycle).

T — Turbocharged

NA — Naturally Aspirated

bhp — Brake horsepower

bkW — Brake kilowatts

*Denotes rating is available in EU and other global regulated and non-regulated areas (Non-U.S.).

—	—	—	—	—	—	—	205	275	2200	—	—	—	—	—	—	

Rating Conditions:

Diesel Engines — up to 7.1 liter

All rating conditions are based on ISO/TR14396, inlet air standard conditions with a total barometric pressure of 100 kPa (29.5 in Hg), with a vapor pressure of 1 kPa (0.295 in Hg), and 25° C (77° F). Performance measured using fuel to EPA specifications in 40 CFR Part 1065 and EU specifications in Directive 97/68/EC with a density of 0.845-0.850 kg/L @ 15° C (59° F) and fuel inlet temperature 40° C (104° F).

Diesel Engines — greater than 7.1 liter

All rating conditions are based on SAE J1995, inlet air standard conditions of 99 kPa (29.31 in Hg) dry barometer and 25° C (77° F) temperature. Performance measured using a standard fuel with fuel gravity of 35° API having a lower heating value of 42 780 kJ/kg (18,390 btu/lb) when used at 29° C (84.2° F) with a density of 838.9 g/L.

Diesel Engine Rating Definitions

Explanation of Ratings A, B, C, D, and E:

- For an exact determination of the appropriate rating, contact your local Cat dealer. Engine rating obtained and presented in accordance with ISO 3046/1.

IND-A (Continuous)

- Continuous heavy-duty service where the engine is operated at maximum power and speed up to 100% of the time without interruption or load cycling.

IND-B

- For service where power and/or speed are cyclic (time at full load not to exceed 80%).

IND-C (Intermittent)

- Intermittent service where maximum power and/or speed are cyclic (time at full load not to exceed 50%).

IND-D

- For service where maximum power is required for periodic overloads (time at full load not to exceed 10% of the duty cycle).

IND-E

- For service where maximum power is required for a short time for initial starting or sudden overload. For emergency service where standard power is unavailable (time at full load not to exceed 5% of the duty cycle).

*Heat rate (MJ/kWh) for gaseous fuel.

NOTES:

- Ratings: Continuous power based on ISO 3046-1 standard reference conditions.
- Power output: May require adjustment for values other than ISO 3046-1 standard reference conditions.
- Fuel as specified per ISO 8217. Limiting Caterpillar specification for fuel is VD8738 for crude oil operation at continuous power operation (COP).
- Fuel consumption: Based on ISO 3046-1 standard reference conditions of 25° C (77° F) and 100 kPa (29.61 in Hg), including one engine-driven lube oil pump, with 5% tolerance and LCV = 42 700 kJ/kg (18,358 Btu/lb).
- Dual Fuel (DF) engines: Specific fuel consumption (g/kWh) for liquid fuel; heat rate MJ/kWh for gaseous fuel.
- Generator efficiency: Efficiency of 97.0% (96.0% for complete CM20 and CM25 model range, and for 6CM32, 8CM32, 9CM32) based on power factor 0.8 with medium voltage class generator; actual efficiency will depend on generator selection.
- Crude oil operation only at continuous power generation.

	Hz	ekW	Standards
C15 ACERT	50	292	EU Stage II
C15 ACERT	50	328	EU Stage II
C15 ACERT	50	364	EU Stage II
C15 ACERT	50	400	EU Stage II
C15 ACERT	60	320	U.S. EPA Tier 3
C15 ACERT	60	365	U.S. EPA Tier 3
C15 ACERT	60	410	U.S. EPA Tier 3
C15 ACERT	60	455	U.S. EPA Tier 2 and Tier 4*
C18 ACERT	50	400	EU Stage II
C18 ACERT	50	436	EU Stage II
C18 ACERT	50	508	EU Stage II
C18 ACERT	50	573	EU Stage II
C18 ACERT	60	500	U.S. EPA Tier 2
C18 ACERT	60	545	U.S. EPA Tier 2
C27 ACERT	60	590	U.S. EPA Tier 2
C27 ACERT	60	635	U.S. EPA Tier 2
C27 ACERT	60	680	U.S. EPA Tier 2
C27 ACERT	60	725	U.S. EPA Tier 2 and Tier 4*

*Meets U.S. EPA Tier 4 Interim Equivalent or U.S. EPA Tier 4 Final emission standards.

All 60 Hz ratings are U.S. EPA emission certified (non-road mobile standards).

All 50 Hz ratings are EU emission certified (non-road mobile standards).

Maintenance of Way Engine Ratings

Sustainability:

- **Major structures and components** are built to be rebuilt, reducing waste and replacement costs.
- **ACERT™ Technology** reduces engine emissions at point of combustion with less moving parts for lower operating costs.

501 HD — Track Harvester Features:

- **Cat® C6.6 ACERT Technology** provides excellent fuel economy and the engines meet U.S. EPA Tier 3/ EU Stage IIIA/Japan 2006 (Tier 3) equivalent emission standards. Flex engines are available for HRC regions.
- **Optional 8.2 m (27 ft) telescopic boom** provides additional reach.
- **Unique front entry cab** allows for easy entry and exit.
- **Tilt cab** provides easy service.
- **Proven x-design carbody and large track system** provide strength and durability.
- **Large heavy-duty swing bearing and swing torque** enhance productivity.
- **Exceptional operator visibility.**
- **IQAN computer based control system** provides precise control of machine and attachment functions.

521B/522B —**Zero Tail Swing Track Harvester Features:**

- **Cat C9 ACERT Tier 3/Stage IIIA/Japan 2006 (Tier 3) equivalent high torque engine** provides excellent power, fuel economy, serviceability and durability.
- **The most robust tilt mechanism** in the industry, the tilting model (522B) has a patented 3-cylinder tilt mechanism with simultaneous tilting forward and side-to-side.
- **Proven rugged undercarriage** designed for the toughest harvesting conditions ranging from wet bottomlands to steep rocky slopes.
- **Hydraulically actuated clam-shell service door** provides full access and reduces maintenance down time.
- **Comfortable, purpose built forestry cab** with heavy duty guarding meets FOPS/ROPS/OPS or OR/OSHA requirements.
- **Flexaire fan (standard)** allows the cooling fan to purge debris from the radiator area minimizing cooling system maintenance.
- **Hydraulic system** is easily adaptable to both harvesting and directional felling heads.
- **IQAN display** allows the operator to continuously monitor the machine and get early warning for potential problems.
- **Ergonomically located pedals with side-by-side foot rests** provide maximum operator comfort when the machine is traveling.
- **Serviceability** has been improved with vertical mounted main hydraulic control valves and increased hood enclosure area. A larger standard fuel tank allows more run time between re-fueling stops.

541 Series 2/552 Series 2 — Full Tail Swing Track Harvester Features:

- **Cat C9 ACERT Tier 3/Stage IIIA/Japan 2006 (Tier 3) equivalent high torque engine** provides excellent power, fuel economy, serviceability and durability.
- **The most robust tilt mechanism** in the industry, the tilting model (552 Series 2) has a patented 3-cylinder tilt mechanism with simultaneous tilting forward and side-to-side.
- **Proven rugged undercarriage** designed for the toughest harvesting conditions ranging from wet bottomlands to steep rocky slopes.
- **Hydraulically actuated dual service door** provides engine/hydraulic access direct from the cab.
- **Walk through service access** minimizes service time and down time costs.
- **Comfortable, purpose built forestry cab** with heavy duty guarding meets FOPS/ROPS/OPS and OR/OSHA requirements.
- **Flexaire fan (standard)** allows the cooling fan to purge debris from the radiator area minimizing cooling system maintenance.
- **Hydraulic system** is easily adaptable to both harvesting and directional felling heads.
- **IQAN display** allows the operator to continuously monitor the machine and get early warning for potential problems.
- **Ergonomically located pedals with side-by-side foot rests** provide maximum operator comfort when the machine is traveling.

521B/522B —**Zero Tail Swing Track Feller Buncher Features:**

- **Cat C9 ACERT Tier 3/Stage IIIA/Japan 2006 (Tier 3) equivalent high torque engine** provides excellent power, fuel economy, serviceability and durability.
- **A robust tilt mechanism**, the tilting model (522B) has a patented 3-cylinder tilt mechanism with simultaneous tilting forward and side-to-side.
- **Proven rugged undercarriage** designed for the toughest harvesting conditions ranging from wet bottomlands to steep rocky slopes.
- **Hydraulically actuated clam-shell service door** provides full service and reduces maintenance down time.
- **Comfortable, purpose built forestry cab** with heavy duty guarding meets FOPS/ROPS/OPS and OR/OSHA requirements.
- **Flexaire fan (standard)** allows the cooling fan to purge debris from the radiator area minimizing cooling system maintenance.
- **Felling heads** utilize high pressure hydraulics and proven components to meet your application requirements.
- **IQAN display** allows the operator to continuously monitor the machine and get early warning for potential problems.
- **Ergonomically located pedals with side-by-side foot rests** provide maximum operator comfort when the machine is traveling.
- **Serviceability** has been improved with vertical mounted main hydraulic control valves and increased hood enclosure area. A larger standard fuel tank allows more run time between re-fueling stops.
- **Hydraulic performance** has been enhanced with new compensator spools, improving implement and travel multi-functioning, and better hydraulic flow sharing between functions.

541 Series 2/552 Series 2 —**Full Tail Swing Track Feller Buncher Features:**

- **Cat C9 ACERT Tier 3/Stage IIIA/Japan 2006 (Tier 3) equivalent high torque engine** provides excellent power, fuel economy, serviceability and durability.
- **The most robust tilt mechanism** in the industry, the tilting model (552 Series 2) have a patented 3-cylinder tilt mechanism with simultaneous tilting forward and side-to-side.
- **Proven rugged undercarriage** designed for the toughest harvesting conditions ranging from wet bottomlands to steep rocky slopes.
- **Hydraulically actuated dual service door** provides engine/hydraulic access direct from the cab.
- **Walk through service access** minimizes service time and down time costs.
- **Comfortable, purpose built forestry cab** with heavy duty guarding meets FOPS/ROPS/OPS and OR/OSHA requirements.
- **Optional hydraulic packages** are available for operation with an intermittent saw or a high speed disc saw.
- **Felling heads** utilize high pressure hydraulics and proven components to meet your application requirements.
- **IQAN display** allows the operator to continuously monitor the machine and get early warning for potential problems.
- **Ergonomically located pedals with side-by-side foot rests** provide maximum operator comfort when the machine is traveling.
- **Flexaire fan (standard)** allows the cooling fan to purge debris from the radiator area minimizing cooling system maintenance.
- **Hydraulic performance** has been enhanced with new compensator spools, improving implement and travel multi-functioning, and better hydraulic flow sharing between functions.

563D/573D Wheel Feller Buncher Features:

- The D Series has been designed for **maximum performance and versatility** to meet multiple customer applications.
- Durable C7.1 ACERT Engine with ACERT Technology meets the demanding power requirements of wheel feller buncher applications while meeting Tier 4 Final/Stage IV/Japan 2014 (Tier 4 Final) emission standards.
- The **high capacity cooling system**, with a hydraulic on-demand reversing fan is designed to operate in high ambient air temperatures and high debris applications while improving component life.
- The **load sense hydraulic systems** provide power on demand and multi-functioning capabilities to all functions of the machine while minimizing fuel consumption.
- A **robust drivetrain** includes a proven hydrostatic drive system and robust Cat axles capable of operating dual tire or wide tire configurations increasing versatility and durability.
- **Heavy duty structures** utilize stream line box section design features, field proven dual taper roller bearing hitch design, integrated steering cylinder mounts, parent plate steering cylinder mounts and oversized chrome plated pins to provide increased life.
- The **transverse mounted engine** provides superior machine stability while providing ground level, single side engine service, ground level fuel and diesel exhaust fluid (DEF) fill, hinged service panels, and pressurized engine/hydraulic and Cat emissions module compartments minimizing potential debris accumulation.
- **Serviceability** has been improved by the transverse mounted engine and other standard features like an electric hydraulic oil fill pump, tilting cab, strategic bulkheads and routings to improve hose and wire harness life and serviceability, and machine fault codes displayed as a text message on the machine monitor to minimize downtime for daily checks, preventative maintenance, and emergency service.
- The **refined operator's station** is positioned evenly between the axles to provide excellent ride quality along with the standard air suspension Cat Comfort seat, high capacity HVAC system, rearview camera, simplified control adjustments and ergonomic controls to reduce operator fatigue.
- **PowerDirect Plus system** optimizes the machine's performance by monitoring operator and attachment demand and delivering power where and when it is needed.

Features:**Structures:**

- Leveraging a chassis design that has accumulated more than 40,000 hours in demanding felling applications, the SATCO Directional Felling Heads have a strong reputation of being one of the most reliable and efficient directional felling heads on the market.

Hydraulics:

- The directional felling heads are 100% hydraulic and do not have any electronics on the head. SATCO's "HOSE THROUGH CENTER" connection to the carrier allows the hoses to travel through the center line of the attaching pins. This prevents the hoses from over bending and causing premature failure. It also protects the hoses from damage when falling trees in dense forests. In addition, the 360 degree continuous rotation rotator allows felling in any possible direction in relation to the carrier without being limited by a rotation stop and without the possibility to damage hoses from over rotation of the head.

Saw Systems:

- The saw units are supported by a large 30 cm (12 in) diameter slew bearing making them a very robust saw unit especially designed for falling large diameter trees. The saw tensioning adjuster is a heavy duty manual adjuster with $\frac{3}{4}$ " pitch chain. The heads also use a unique locking system for the saw sprocket to prevent broken drive shaft keys and damaged saw motor shafts.

Applications:

- The SAT420 is ideally matched with a Cat 320D FM harvester for efficient felling. The head is most effective when single felling trees between 305–508 mm (12–20 in). The shorter tilt frame and chassis and the smaller jaw opening provide quick motion to reset the felling head for the next cut compared to a SAT630.
- The SAT630 is ideally matched with a Cat 324D FM Harvester or Cat 522B leveling track harvester. The head provides the most benefit when single felling trees between 457–762 mm (18–30 in). However the SAT630 becomes more effective than the SAT420 when the majority of the trees being felled exceed 500 mm (20 in).

Owning & Operating Costs:

- Both directional felling heads provide low owning and operating costs when compared to traditional high speed disc felling heads. Not only do the directional felling heads require less horsepower, consume less fuel, the heads also provide less stress on carrier components such as pins, bushings, stick, and boom joints due to the floating motion of the head once the trees are felled.

Harvesting SATCO Directional Felling Heads

Specifications

MODEL	SAT420		SAT630	
Weight	1450 kg	3100 lb	2000 kg	4400 lb

Directional Felling Heads	Forest Machines	Track Harvesters
SAT420	320D FM/324D FM/325D FM	521B/522B/501HD
SAT630	324D FM/325D FM	521B/522B/541 II/552 II

Application:

- This product is specifically designed for applications, which require removal of the bark. The HH44 DE cannot be used in a standard harvesting application.

Features:

Operator Station:

- Utilizes a mobile purpose built Microsoft Windows based computer system.
- Equipped with: color touch screen, heavy-duty processor housing, and mini space saving keyboard with integral track ball mouse.

Structures:

- Use of a chassis design that has proven effective in Eucalyptus, improvements were made to the structure to provide a durable frame for high cycle debarking applications.

Hydraulics:

- Heavy Duty double-hinged self-aligning covers allow for superior access and easier serviceability to the hydraulic valve.
- Mono-block valve decreases maintenance repairs and gives users easier control of all harvester head functions.

Measuring Devices:

- New length and diameter measuring systems increase reliability and reduces maintenance.
- Wide temperature range ensures accurate measurements.

Hoses:

- Cat XT™ ES (Enhanced Spiral) ToughGuard hoses are designed to have exceptional abrasion resistance and increased flexibility superior to standard hoses.

MODEL	HH44 DE	
Knives	2 fixed, 4 moveable

in	21.7	42.5	68.0	81.0	50.0	69.8

Features:**Structures:**

- SATCO processing heads are designed with high tensile strength materials and utilize large pins for durability. The roller arm and knife pins on the heads are retained using SATCO's "DEAD-LOCK" pin retention system utilizing the pin for added strength in the chassis. The "DEAD-LOCK" pin retention system also prevents the pin from moving in all three axis improving bushing life and extending service intervals.

Hydraulics:

- A Rex Roth main valve is used on all SATCO processing heads and is rated at 420 bar (6100 psi) eliminating the need for carrier pressure reduction. SATCO's "HOSE THROUGH CENTER" connection to the carrier allows the hoses to travel through the center line of the attaching pins preventing the hoses from over bending and causing premature failure. It also protects the hoses from damage when falling trees in dense forests.

Saw Systems:

- SATCO processing heads utilize two different main saw systems depending on the head model. Most heads come equipped with SATCO's designed ¾" manual tension main saw system. The main saw units are supported by a large 30 cm (12 in) diameter slew bearing making them a very robust saw unit. The saw tensioning adjuster is a heavy duty manual adjuster with ¾" pitch chain. The heads also use a unique locking system for the saw sprocket to prevent broken drive shaft keys and damaged saw motor shafts.
- The SAT214, SAT318T SC, SAT322T SC, and SAT323T SC all utilize the Hultins SuperCut 100. The SC100 features 0.404" automatic chain tensioning and an integrated lubrication system.
- The SuperCut 100 is also used on most of the heads denoted by a "T" as a topping saw. This feature provides added versatility to the operator when processing. The one exception is the SAT325T which is equipped with the same SATCO designed ¾" saw system for both the main and topping saws.

Applications:

- The SAT214 is designed for pine thinning and select cutting smaller mixed stands. This head performs well in pine plantations and mixed natural stands.
- The SAT318/SAT318T/SAT318T SC are equipped with TMVW drive motors designed for lighter weight timber and perfect for feeding down to small diameters.
- The SAT322/SAT322T/SAT322T SC are equipped with HD hubs on the drive motors and work perfectly for larger heavy timber while still maintaining the ability to install on a 320D FM or a 521B/522B track harvester.
- The SAT323/SAT323T/SAT323T SC are equipped with MS11 drive motors providing increased torque. These heads paired with the 324D FM/325D FM machines have the capacity to consistently process large timber.
- The "SC" versions of the 18, 22, 23 inch heads works well for softwood applications and provides faster cutting cycles.
- Debarking is the specialty of the SAT422 DB and can handle a wide range of eucalyptus and acacia trees.
- The SAT223/SAT223T are best suited for processing short wood (6 m [20 ft]) or less. It is equipped with four knives and provides optimal delimiting of large limby wood.
- The largest offering is the SAT325/SAT325T and is designed for our largest FM the 568 FM. These heads work with the largest timber our machines can handle and stand up to the toughest applications.

Control System:

- SATCO heads have two control system options the Plus-1 and d5 Bucking Prio designed to suit many markets around the Globe.
- The Plus-1 system provides diameter based priority cut selection, simple length and diameter calibrations, metric or imperial display units as well as multiple languages. The Plus-1 measuring and control system is simple to use and does not require a PC in the cab. The system is ideal for customers who do not require sophisticated measuring systems.

- The d5 Bucking Prio control system is focused on simplicity, ease of operation, and provides priority bucking by prioritizing length and diameter calculations. The system also has the ability for production reporting and adding additional applications such as GPS* and Operational Monitoring*.

*Optional.

MODEL	SAT214	
Knives	1 Upper Fixed 4 Moveable/4 Cutting Edges	
Weight	1370 kg	3020 lb
Capacity	30-350 mm	1.25-14"
Close Minimum	30 mm	1.25"
Maximum Top Knives Open	600 mm	24"
Maximum Bottom Knives Open	600 mm	24"
Maximum Rollers Open	600 mm	24"
Maximum Feed Force:		
2 × TMVW 500 cc	18 kN	4046 lbf
2 × TMVW 630 cc	21 kN	4721 lbf
Maximum Feed Speed:

525D/535D/545D/555D Wheel Skidder Features:

- The Cat C7.1 ACERT engine is designed to deliver more power than ever before, while still achieving the highest levels of total fluid efficiency, reliability and durability.
- The **high capacity cooling system** and on-demand hydraulically driven reversing fan keep the machine running at the proper operating temperature, optimizing performance, durability and fuel efficiency. The system, designed to meet the cooling requirements of the 555D, is common to all models, boosting fuel efficiency and capacity in the smaller models.
- Power to the ground is an advantage of the Cat D Series **power train**. The axles are designed specifically for the skidder application and the gear ratios cause the power to be generated in the axles reducing torque in the transmission and drivelines extending their life. Both drawbar performance and durability are improved.
- The **high performance hydraulic system** provides more speed, increased multifunctioning capability and greater lift capacity. This efficient load sense system with variable displacement pump continually monitors hydraulic power requirements and provides power based on demand to save fuel.
- **Rock solid stability** through improved weight distribution and a longer wheelbase keep the skidder solid, even in turns. Robust frames provide a solid foundation for a machine designed to provide long life. Every structure was engineered for durability and verified through lab and field tests.
- Logging and retrieval **winch**s are available as options. Both are hydraulically driven, have the same pulling power and feature friction style clutches for increased durability and functionality.
- The **refined operator's station** is positioned evenly between the axles to provide excellent ride quality along with the high back air suspension seat, high capacity HVAC system, and ergonomic controls to reduce operator fatigue.
- **Serviceability** of the D Series is significantly improved with the tilting cab, redesigned grapple head and improved hose routings. The cross flow configuration and compartmentalization reduce debris collection around the engine, so less time is needed for cleaning.
- **Integrated technologies** like the machine troubleshooting feature which allows the operator to drill down and pinpoint the root cause of a problem, reducing the need for service calls and holding down costs. Product Link™ is also integrated to collect and deliver valuable information which is important with logging sites in remote areas.

Introduction

The Cat 527 Skidder is designed and built specifically for log skidding applications. The 527's extended track roller frame and weight-forward bias make it well suited for mountainous and soft underfoot logging operations. The skidder's ergonomic and spacious operator's environment allow for increased comfort and production. The 527's standard forestry guarding and undercarriage design ensure the durability required in logging applications. Both Cable and Swing-boom Grapple configurations are provided to suit a wide range of skidding applications.

Features 527:

- **Field proven Cat 3304 diesel engine** sets the industry standard for reliability and durability, delivering high horsepower for more drawbar pull, improved skidding performance and ease of operation.
- **Large, heavy duty torque converter**, reduces the tendency for track-to-ground slip, reduces the need for up and downshifting and protects power train components contributing to longer component life.
- **3 speed planetary powershift transmission** works best in high-pull applications and is well suited for large load and steep terrain skidding.
- **Heavy-duty track roller frame** extended to the rear significantly improves traction capability under heavy loads and uphill skidding applications.
- **Wide gauge and long track roller frames** provide outstanding sidehill stability.
- **Improved flotation** — More track on the ground distributes tractor weight and propulsion forces over a much larger area than conventional track skidders. This improves flotation capabilities, gradeability and significantly reduces soil impact.
- **Load sensing hydraulic system** — Variable displacement pressure compensating hydraulic system provides reduced power requirements when there is not hydraulic demand, significantly reduced heat generation, and improving fuel efficiency.
- **Auto-grab feature** — provides constant grapple tong pressure without continuous hydraulic pump demand.
- **Superior component durability** — Final drives are raised above the work area, isolating the power train from ground impact shock and abrasive materials.
- **Excellent ground clearance** — no diagonal braces allow the skidder to pass over stumps and debris, reduces maneuvering for reduced cycle times and minimizes soil impact.
- **Smooth belly pans** — Less likely to hang up in mud and debris in soft ground or swamp logging applications.
- **Easy and comfortable operating environment** — The seat is angled and controls are easily reached to reduce operator fatigue and increase productivity. Optional enclosed ROPS/FOPS cab allows excellent front and rear viewing, and is pressurized for sound level reduction.
- **Single lever** grapple control and blade control.
- **Less service time** — Major components are made as modules and most can be removed without removing others, and ground-level access provides convenient servicing to most filters and lube points.
- **Cable and Swing Boom** configurations provide the versatility needed to match the skidder to a wide variety of skidding applications.

KEY

- 1 — 1st Gear
- 2 — 2nd Gear
- 3 — 3rd Gear

NOTE: Usable pull will depend upon weight and traction of equipped tractor.

BOOM AND GRAPPLES

The following contains information on some of the available models, which are presented here to suggest a range of grapple possibilities.

Reach (A, B) — The horizontal distance from the vertical center of the rear idler to the vertical center of the grapple fore and aft pivot.

- A) With the grapple in its lowest fully extended position.
- B) With the grapple in its highest fully retracted position.

Lift (C, D, E) — The vertical distance from the ground to the center of the grapple fore and aft pivot.

- C) With the grapple in its highest fully extended position.
- D) With the grapple in its highest fully retracted position.
- E) With the grapple in its lowest fully extended position.

Maximum Grapple Opening (K) — The horizontal distance between the tips of the grapple arms when grapple is fully open.

Area of Opening (L) — The available area with grapple in tips together position.

Minimum Log Size (M) — The smallest diameter which the grapple can close.

Grapple Length (N, O, P) — The distance from the grapple fore and aft pivot to tips of grapple arms.

- N) With grapple fully open.
- O) With grapple in tips together position.
- P) With grapple fully closed.

Bunching Grapple

- Used for 305 mm (12") or smaller diameter trees.
- Designed to gather bundle of stems and maximize grapple loads.

Grapples for 527	K	L	M	N	O	P
2.79 m (110") Bunching	2794 mm 110"	0.93 m ² 10 ft ²	76 mm 3"	1780 mm 70"	2020 mm 79.5"	1360 mm 53.5"

Swing-boom

- Ability to reach and lift over the side to collect scattered logs.
- Has decking and loading capability.
- Excellent reach to the rear and side for maximum skidder versatility.
- Suitable for hard to reach timber on steep slopes, soft ground, or selection harvest and thinning.
- Reduces cycle times by reducing the amount of maneuvering of the skidder to reach logs.

Swing-boom		A	B	C	D	E	F
527	mm	3329	1301	4084	2792	1358	933.5
	in	131.1	51.2	160.8	109.9	53.5	36.8

Sustainability:

- **Major structures and components** are built to be rebuilt, reducing waste and replacement costs.
- **ACERT Technology** reduces engine emissions at point of combustion with less moving parts for lower operating costs.

564/574 Features:

- **Field-proven Cat engines with ACERT Technology**, along with a torque converter power shift transmission. The engines meet Tier 3/Stage IIIA/Japan 2006 (Tier 3) equivalent emission standards. Flex engines are available for HRC regions.
- **Large high visibility cab** with scratch resistant 1.27 cm (0.5 in) tinted polycarbonate windows and side windows with escape.

- **Hydraulic tilt** gives complete under cab service access.
- **Extra heavy frame** with full 40 degree articulation for tight turning.
- **Purpose-built blade** with wear resistant front cutting edge.
- **Rear mounted loader** with durable rack and pinion swing system.
- **Full load high reach boom.**
- **250 degree rotation.**
- **European style butt-bypass clam** built with high strength steel dampener.

Sustainability:

- **Major structures and components** are built to be rebuilt, reducing waste and replacement costs.
- **ACERT Technology** reduces engine emissions at point of combustion with less moving parts for lower operating costs.
- **Speed modulated hydraulically driven cooling fan** for decreased power requirements resulting in reduced fuel consumption.
- **1800 RPM engine** for reduced engine speeds to provide increased fuel economy.

584/584HD Features:

- **Cat C7 ACERT engine** with 1800 RPM rating and excellent torque in the 1400 to 1600 RPM range for increased fuel efficiency. The engines meet Tier 3/ Stage IIIA/Japan 2006 (Tier 3) equivalent emission standards suitable for LRC regions.
- **Enlarged hydraulic cooling capacity** to provide high heat rejection capability for extended component life.
- **Hydraulic driven cooling fan** with speed modulation for reduced fuel consumption and maintaining optimal system temperatures for better component performance.

- **Hydrostatic drive system** for infinitely variable speed at peak power and dynamic braking for steep terrain.
- **8.5C drive line components** provide superior strength and service life for reduced maintenance costs.
- **Robust front and rear frame structures** provide the ability to rebuild/relife to reduce overall ownership costs and increase resale values.
- **Heavy duty cast articulation and large oscillation bearing** designed to provide a long service life.
- **Ergonomic cab** with automatic temperature control, air suspension seat, storage compartments, and low effort joy stick controls.
- **Drop down side window** design for enhanced visibility to the work area close to the machine and in front of all wheels.
- **Front entry door** provides easy access off of a hydraulic lift stairway and platform.
- **Forward tilting engine hood and hydraulic tilt cab** for easy service access.

Lift Capacities

Introduction

Cat forestry machines are specifically designed for tough forest work. Each model uses purpose built booms, sticks and grapples designed by Caterpillar for maximum performance and durability.

The following information provides features, specifications, dimensions, working ranges and major component weights for the forest machines.

Features

320D Series 2 FM/320D Series 2 FM LL

- **Cat C7.1 ACERT engine** provides power, low emissions, outstanding reliability, and maximizes fuel economy. Meets Tier 3/Stage IIIA/Japan 2006 (Tier 3) equivalent emission standards.
- **Various configurations** for demanding applications including harvester, log loader, slasher, road builder, thumb, grapple saw, AEM delimeter carrier and processor.
- **Rugged undercarriage design and proven structural components** provide outstanding durability.
- **Track roller frames** are robot-welded and pressed formed, pentagonal units to deliver exceptional strength and service life.
- **Undercarriage** — Forestry machine configuration options allow you to choose the right machine for your application.
- **Operator station** — Redesigned interior layout maximizes operator space, provides exceptional comfort and reduces operator fatigue.
- **Serviceability** — Longer service intervals and easier maintenance result in better machine availability and lower costs.

538/538 LL

- **Cat C7.1 ACERT engine** provides exceptional fuel efficiency while delivering maximum power for this machine side class and meeting Tier 4 Final/Stage IV/Japan 2014 (Tier 4 Final) emission standards.
- **Optimized hydraulics** minimize losses due to inefficiencies through component design, component layout and finely tuned machine and work tool parameters.
- **Performance** is enhanced by 18% more swing torque than previous model that helps maximize work site efficiency.
- **Rugged frame designs** are purpose built for forest applications; these include reinforcements to the upper frame, heavy duty doors and guarding, rugged swing bearing, reinforced carbody and roller frames that help protect your investment.
- **Undercarriage** updates include 203 mm (8 in) wider undercarriage than previous model and 203 mm (8 in) pitch 329 HEX PPR2 track; roller frames include eight rollers total.
- **Engineered reliability** is provided through the use of proven Cat components and increased cooling capacity.
- **Diverse machine configurations** are available to meet the many applications of today's forest machines; these include front omission, road builder, rotate grapple, processor, under/under, over/under, powerclam, and material handler options.
- **Operator station** consists of updated seat with heated and ventilated functionality along with a new improved LCD display that is 40% larger and includes four times the screen resolution; LED lights are standard on the machine.
- **Diverse work tool options** include integrated SATCO processing heads and GLL grapples; both deliver high performance and reliability in severe logging applications.

324D FM/324D FM LL/325D FM/325D FM LL

- **Cat C7 ACERT engine** provides exceptional power and fuel efficiency. Meets Tier 3/Stage IIIA/Japan 2006 (Tier 3) equivalent emission standards.
- **Attachments** — Factory installed log loader fronts with live heel and Cat grapples; harvester, road builder and butt-n-top fronts; AEM delimeter carrier options help meet diverse forest applications.
- **Cat GLL forestry grapples**, built with high-grade steel throughout the grapple, matched with Cat Forest Machines provide high performance and reliability in logging applications.
- **Rugged main frame design** is purpose-built for forest applications with reinforced carbody, rugged swing bearing, heavy doors and extra guarding.
- **Undercarriage** — Both 324D FM and 325D FM feature new lowers with heavier undercarriage components, 9 roller track frames, and improved machine stability.
- **Operator station** — Interior layout maximizes operator space and provides exceptional comfort. Cab has excellent sightlines to the work area.
- **Serviceability** — Simplified service and maintenance, and electronic diagnostics help save time, money and increase productivity.

558 LL

- **Cat C7.1 ACERT engine** provides exceptional fuel efficiency while delivering maximum power for this machine side class and meeting Tier 4 Final/Stage IV/Japan 2014 (Tier 4 Final) emission standards.
- **Optimized hydraulics** minimize losses due to inefficiencies through component design, component layout and finely tuned machine and work tool parameters.
- **Performance** is enhanced by 25% more swing torque than previous model that helps maximize work site efficiency.
- **Rugged frame designs** are purpose built for forest applications; these include reinforcements to the upper frame, heavy duty doors and guarding, rugged swing bearing, reinforced carbody and roller frames that help protect your investment.
- **Undercarriage** includes roller frames that deliver nine rollers for needed stability and to minimize point loading; 216 mm (8.5 in) pitch 349 HEX track are used for durability.
- **Engineered reliability** is provided through the use of proven Cat components and increased cooling capacity.
- **Diverse machine configurations** are available to meet the many applications of today's forest machines; these include under/under, over/under, processor, power-clam, and material handler options.
- **Operator station** consists of updated seat with heated and ventilated functionality along with a new improved LCD display that is 40% larger and includes four times the screen resolution; LED lights are standard on the machine.
- **Diverse work tool options** include integrated SATCO processing heads and GLL grapples; both deliver high performance and reliability in severe logging applications.

568/568 LL

- **Cat C9.3 ACERT engine** provides exceptional power and fuel efficiency, meeting Tier 4 Interim/Stage IIIB/ Japan 2011 (Tier 4 Interim) equivalent emission standards.
- **Attachments** — Factory installed log loader fronts with live heel and Cat grapples; harvester, road builder and butt-n-top fronts; help meet diverse forestry applications.
- **Cat GLL forestry grapples**, built with high-grade steel throughout the grapple, matched with Cat Forest Machines provide high performance and reliability in logging applications.
- **Reinforced carbody design** stands up to the most demanding forest applications, assuring outstanding durability and service life.
- **Undercarriage** — Heavy-duty link assemblies provide toughness and durability, maximizing undercarriage life and minimizing operating costs. Long 10 roller track frames provide excellent machine stability and maneuverability on steep slopes.
- **Guarding** — Purpose designed guarding helps extend service life, reduces downtime and helps protect your forestry machine investment.
- **Operator station** — Spacious, quiet, automatically climate controlled cab has excellent sightlines to the work area. Cat offers a premium rear entry cab for those regions or operations that require this functionality.
- **Serviceability** — Simplified service and maintenance, and electronic diagnostics help save time, money and increase productivity.

Processing/Loading Trailer Mount Knuckleboom Loaders

Features Specifications

529/559C/579C Features:

- **Advanced boom design technology** built tough with welded high-strength steel.
- **Booms** are engineered to withstand high production pull-through delimiting and loading.
- **Boom reach** ranges from 8.8 m (29 ft) on the 529 up to 10.9 m (36 ft) on the 579C.
- **Smooth and responsive joystick controls.**
- **Swing torque ratings** up to nearly 100 kN·m (73,700 lb-ft), combined with swing speeds up to 11 RPM.
- **Continuous rotation grapples** are constructed of wear resistant, high tensile steel with heavy-duty rotators designed for strenuous pull-through delimiting applications.

- **Heavy-duty sub-frames** are engineered for high reliability and stability.
- **Heavy duty off road axles** provide trouble free operation in the harsh woods environment.
- **Quiet, comfortable cabs** with excellent visibility.

Loaders offered with a factory matched performance package — The “DS” package is a complete factory installed timber merchandising system consisting of a knuckleboom loader and grapple, trailer with trailer mounted delimitter.

MODEL	529		559C		579C

Lift and Range Diagram ● 529 Knuckleboom Loader

**529 Knuckleboom Loader
8.8 m (29'0") Boom**

NOTES:

Do not attempt to lift or hold any load that is greater than the rated values over the end or side. The weight of the grapple and all lifting accessories must be deducted from lift capacities shown.

1. The over end capacities and over side capacities do not exceed 87% of hydraulic limited capacity or 75% of stability limited capacity.
– Stability limited capacities are indicated with an asterisk (*).
2. The lift point is located at the grapple knuckle pin.
3. Lift capacities are based on the machine standing on firm, uniform supporting surface. User must make allowances for job site conditions.
4. Operator should be fully acquainted with the Operator's Manual and all safety instructions furnished by Caterpillar Inc. prior to operating the machine.
5. Lift capacities are in compliance with SAE J2417, "Lift Capacity Calculation Method – Knuckleboom Log Loaders and Certain Forestry Equipment."

519/569 Features:

- **Heavy-duty boom options** range in length from 8.2 m (27 ft) to 10.90 m (36 ft) for handling a variety of tree lengths.
- **Weatherproof electric service panels** include starters, controls, transformers, circuit breakers and fuse blocks.
- **Electric motors** are rated for severe duty.
- **Resilient Pad Mounting System** includes a set of special rubber isolators on each mounting fastener that absorbs stress in two directions.
- **Hydraulic pilot joystick controls and rocker swing pedal** are ergonomically designed for ease of operation and maximum loader control.

*NOTE: Other Electric Power options available by special quote.

Electrical Code Requirements:

Cat Electric Stationary Mount Loaders are designed to meet National Electrical Code (NEC) requirements in the United States. However, the Dealer/Customer is responsible to investigate local Electrical Code requirements that may exist and make updates as required to the machine to meet additional local requirements.

Incoming Supply Power Requirements for the Stationary Mount Loaders:

Incoming supply power specification for all stationary mount loaders must be within $\pm 5\%$ of nominal for proper operation/reliability of the machine. A customer/dealer supplied transformer must be installed to accommodate the incoming power requirements if needed.

Millyards Stationary Mount Knuckleboom Loaders

Dimensions

NOTE: Overall height dimension to 8.2 m (27'0") boom articulation point is taken with main boom cylinder fully extended. Add 76.2 cm (30") to this dimension for 9.1 m (30'0") knuckleboom.

NOTE: Overall height dimension to 9.1 m (30'0") boom articulation point is taken with main boom cylinder fully extended. Add 106.9 cm (42") to this dimension for 10.9 m (36'0") knuckleboom.

Resilient Pad System

- Operator's cab is not present on EHC models.
- EHC models available with Remote Power Packs.
- Installations on concrete include "J" Bolts in lieu of Mounting Bolt.
- Continuous rotation units require 76.2 cm (30") minimum working clearance beneath subframe or collector ring and wiring maintenance.
- The customer is responsible for the design and engineering of all mounting systems and Caterpillar Forest Products recommends that the customer employs an engineer to perform this work.
- For additional installation guidelines refer to the Steel or Concrete information drawing for the stationary mount loader being installed. These information drawings along with engineering data to assist in the design of the support structure for the stationary mount loader are available from Caterpillar Forest Products upon request by the authorized dealer.

Millyards Stationary Mount Knuckleboom Loaders

519 SM/519 SM/EHC 8.2 m (27'0") Boom

NOTES:

Do not attempt to lift or hold any load that is greater than the rated values over the end or side at their specified lift point and height. The weight of the grapple and all lifting accessories must be deducted from lift capacities shown.

1. All figures shown in these charts represent rated lift capacities.
2. Capacities shown in *italic* are 100% of hydraulic capacity; other capacities shown are 87% of hydraulic capability.
3. The lift point is located at the boom/grapple pivot pin.
4. Manufacturer assumes no responsibility for the proper fit or structural integrity of the mounting pedestal and/or platform supplied by the customer.
5. Operator should be fully acquainted with the Operator's Manual and all safety instructions furnished prior to operating the machine.
6. Lift capacities are in compliance with SAE J2417, "Lift Capacity Calculation Method – Knuckleboom Log Loaders and Certain Forestry Equipment."

- 519 SM Knuckleboom Loader
 - 519 SM/EHC Knuckleboom Loader

519 SM/519 SM/EHC 9.1 m (30'0") Boom

NOTES:

Do not attempt to lift or hold any load that is greater than the rated values over the end or side at their specified lift point and height. The weight of the grapple and all lifting accessories must be deducted from lift capacities shown.

1. All figures shown in these charts represent rated lift capacities.
2. Capacities shown in *italic* are 100% of hydraulic capacity; other capacities shown are 87% of hydraulic capability.
3. The lift point is located at the boom/grapple pivot pin.
4. Manufacturer assumes no responsibility for the proper fit or structural integrity of the mounting pedestal and/or platform supplied by the customer.
5. Operator should be fully acquainted with the Operator's Manual and all safety instructions furnished prior to operating the machine.
6. Lift capacities are in compliance with SAE J2417, "Lift Capacity Calculation Method – Knuckleboom Log Loaders and Certain Forestry Equipment."

Wheel Loader Forestry Features:

988K — Logging Arrangement equips the 988K with larger lift and tilt cylinders, additional counterweight, and 3V hydraulics. Heavy-duty tires (42PR or **) are required for the strength and durability required in millyard applications. Work tool attachments, such as logging forks are designed for heavy-duty applications; loading and unloading trucks, sorting, decking and feeding the mill.

990H — The 990H Millyard Arrangement equips the machine with larger lift and tilt cylinders, extra counterweight, and 3V hydraulics for top clamp control. The larger machine is recommended for millyards which may have uneven terrain where more stability is required.

980M/980K/980H — Forest Machine Arrangement equips the 980M, 980K, and 980H with an extreme service transmission, heavy-duty tilt cylinders and additional counterweight for the strength and durability required to be productive in this tough application. Logging, millyard and wood pallet forks, woodchip and clean-up buckets can be added to equip the machines for forestry applications.

966M/966K/966H — Forest Machine Arrangements on the 966M, 966K, and 966H provide ride control, heavy-duty tilt cylinders and an additional counterweights for use in forestry and logging applications. Specially designed work tools for forestry applications can be factory-installed.

950M/962M/950K/962K/950H — Forest Machine Arrangements on the 950M, 962M, 950K, 962K and 950H provide ride control, heavy-duty tilt cylinders and an additional counterweights for use in forestry and logging applications. Specially designed work tools for forestry applications can be factory-installed.

MODEL	988K	
Operating Weight	61 241 kg	135,014 lb
Engine Model	C18 ACERT	
Full Turn Static Tipping Load (Logging Forks)	31 079 kg	68,517 lb
	@ 37 degree articulation	

926M* with Fusion Coupler — Cat 1829 mm (72") Log and Lumber Fork

Tine Length	1829 mm	72.0"
Load Center	914 mm	36.0"
Static Tipping Load — Straight (Forks Level)	5991 kg	13,204 lb
Static Tipping Load — Articulated (Forks Level)	5134 kg	11,315 lb
Rated Load (SAE J1197 — 50% FTSTL)	2567 kg	5658 lb
Rated Load (CEN EN 474-3 Rough Terrain — 60% FTSTL)	3080 kg	6789 lb
Rated Load (CEN EN 474-3 Firm and Level Ground — 80% FTSTL)	4107 kg	9052 lb
Reach with Arms Horizontal and Forks Level	1590 mm	62.6"
Reach with Fork at Maximum Height	788 mm	31.0"
Ground to Top of Tine with Arms Horizontal and Fork Level	1755 mm	69.1"
Ground to Top of Tine at Maximum Height and Fork Level	3656 mm	143.9"
Operating Weight	13 615 kg	30,007 lb

*Meets Tier 4 Final/Stage IV/Japan 2014 (Tier 4 Final) emission standards.

- Tilt Capacity

Curves based on machine with full fuel tank, operator, ROPS cab, 45/65R39 tires. Extra counterweight as supplied by Millyard Arrangement. 315-0458 millyard forks. Total operating weight 89 963 kg (197,919 lb).

NOTE: Static tipping load and operating weight are based on machine configuration with standard tires, full fuel tank, coolant, lubricants, and operator.

Specifications and ratings conform to all applicable standards recommended by the Society of Automotive Engineers (SAE). SAE Standards J732 JUN92 and J742 FEB85 govern loader ratings.

The rated operating load for a machine with fork is: SAE J1197; 50% of full turn static tipping load, or hydraulic/structural limit. CEN 474-3: 60% of full turn tipping load on rough terrain; 80% of full turn tipping load on firm and level ground, or hydraulic structural limit.

586C Site Prep Tractor Features:

- The C Series has been designed for **maximum performance and increased model versatility** to meet multi-customer applications.
- Durable Cat C9 and C9.3 Engines with ACERT Technology meet the demanding power requirements of site prep tractor applications while meeting Tier 4 Interim/Stage IIIB/Japan 2011 (Tier 4 Interim) or Tier 3/Stage IIIA/Japan 2006 (Tier 3) equivalent emission standards.
- The **high capacity cooling system**, with a hydraulic on-demand reversing fan, is designed to operate in high ambient air temperatures and extremely high debris applications while improving component life.
- The **load sense hydraulic systems** provide power on demand and multi-functioning capabilities to all functions of the machine while minimizing fuel consumption. **Cold weather system protections** have been designed into the system to maximize component durability.
- **PowerDirect Plus** optimizes the machine's performance, including the **high performance attachment hydraulic system**, by monitoring operator and attachment demand and delivering power where and when it is needed.
- A **robust drivetrain** includes a proven hydrostatic drive system, robust Cat axles, and **propel creep control** with on the fly adjustability to infinitely adjust ground speed for the application.
- **Heavy duty structures** utilize stream line box section design features, field proven dual taper roller bearing hitch design, integrated steering cylinder mounts, parent plate steering cylinder mounts and oversized chrome plated pins to provide increased life.
- The **transverse mounted engine** provides superior machine stability and ride quality while providing superior engine service, ground level fuel fill, hinged service panels, and pressurized engine/hydraulic and Cat emissions module compartments minimizing potential debris accumulation.
- **Serviceability** has been improved by the transverse mounted engine and other standard features like an electric hydraulic oil fill pump, tilting cab, strategic bulk heads and routings to improve hose and wire harness life and serviceability, and machine fault codes displayed as a text message on the machine monitor to minimize downtime for daily checks, preventative maintenance, and emergency service.
- The **refined operator's station** is positioned between the axles to provide excellent ride quality along with the standard air suspension seat, high capacity HVAC system, and ergonomic controls to reduce operator fatigue. The **attachment float control** option also reduces operator fatigue and improves performance.

Features:

Loader Fork

- Few work tool lines can match the range and utility of Cat Forks. Forks transform loaders into high performance material handling platforms capable of sorting, stacking and working wherever product, palletized material or lumber is at hand.

Millyard and Logging Forks

- Cat Millyard and double top clamp forks are performance-matched to Cat Wheel Loaders for unmatched on-the-job performance. The design features of fork and loader complement each other to make the ideal total system solution for log handling applications. Both forks are ideally suited for heavy-duty applications: loading and unloading trucks, sorting, decking, and feeding the mill.

Log and Lumber Forks

- Handle logs or finished lumber with equal ease. The top clamp holds loose loads securely, and the pallet-style forks make short palletized material. This versatility makes them suitable for a wide range of jobs including loading trucks, decking and sorting lumber or logs.

Features — Couplers

Fusion Couplers

- Fusion Quick Couplers provide unmatched versatility to any loader. Change tools in seconds without leaving the cab. Any work tool backed by coupler hooks can be picked up; allowing the loader to fit whatever application is at hand.

Center-Lock™ Pin Grabber Couplers

- The Cat Center-Lock Pin Grabber Coupler allows buckets and other standard work tools to be used without any modification. Exchanging work tools in seconds improves overall production and increases machine versatility. The Coupler is pinned on in place of the bucket with standard pins, and can be easily removed should the need arise to mount a tool directly to the stick.
- The Center-Lock Coupler offers new possibilities. Buckets can be turned around and used in front shovel mode for final trench clean up. An integral lift eye on the coupler body allows lifting without the weight of the bucket, increasing both machine capacity and visibility from the cab.

Features — Buckets and Thumbs

Cat Bucket Thumbs for Hydraulic Excavators

- Multiply the performance of a Cat Excavator by adding a Cat Bucket Thumb. This highly versatile work tool acts in conjunction with the bucket to allow the excavator to grab irregularly shaped items and load loose materials and debris.

Mini Bucket Thumbs

- Cat Bucket Thumbs are matched to Hydraulic Excavator Buckets for increased on-the-job performance. A thumb works with the bucket to grab, pick and sort debris, brush, trash and rock, opening up new production opportunities for your Cat Mini Excavator. Thumbs are an ideal complement to excavators working in demolition, land clearing, landscaping, material handling and construction jobs.

Clamshell Buckets

- Cat Clamshell Buckets are the premier tools for cleanup, demolition, ground clearing and forestry work. Built of heavy T1 steel, these buckets are tough and durable for long service life in the most difficult applications. Clamshell buckets feature continuous 360° rotation, powered by a high-torque hydraulic motor.

Features:**Buckets, U-blades, Bowldozers, Chip Scoops**

- The high-capacity, high-efficiency design of these tools makes them high-production workhorses. They are matched to specific machines and material densities for optimum performance. The extra capacity and load retention capabilities ensure maximum usage and productivity.

Depth	2.46 m	8'1"	2.95 m	9'8"	3.02 m	9'11"
Weight	5390 kg	11,880 lb	11 420 kg	19,125 lb	11 105 kg	24,480 lb

NOTE: For specifications of Woodchip Dozers used on track-type tractors, see the Bulldozer section in this handbook.

Features — Rakes

Loader, Clearing and Clamp and Blade Rakes

- Rakes are durable, high-capacity tools that will increase production for land clearing, site cleanup and site preparation. Available in quick coupler and pin-on models, rakes pile brush, stack and carry debris and load trucks. Features include thick, fabricated teeth, a heavy-duty push bar and serrated tree pusher. A high brush rack retains the load, prevents back spillage and increases carrying capacity.

USE OF LOG VOLUME TABLES

The tabulated volumes on these pages were calculated with no taper in log diameter from base to top. Therefore each value listed in the table represents the volume of a true cylinder. In practice this may occur only in short sections of large diameter trees. To obtain the volume of solid wood logs, excluding bark:

1. Establish the base diameter of the log inside the bark and above the butt flare (extreme end taper).
2. Repeat the procedure for the top (small end) of log.
3. Enter log volume table at each of the two established diameters. Move horizontally to the vertical column closest to the length of the log being measured.
4. Establish the volume figures for each end of the log, add the two together and divide by two to obtain average log volume.

METRIC LOG VOLUMES (in Cubic Meters)

UNIT OF MEASUREMENT DEFINITIONS

1 board foot	= 1/12 ft ³ of solid wood (1' × 1' × 1")
1000 board feet	= 83.33 ft ³ of solid wood
1 c. unit of wood	= 100 solid ft ³ = 1200 board feet = 2.83 ³
1 cord of wood	= 128 ft ³ of stacked logs = 3.62 m ³
1 unit of wood	= 200 ft ³ of loose chips = 5.66 m ³
1 cord of wood	= 0.85 units
1 Hoppus Ton	= 50 ft ³ (assumed) = 63.65 ft ³ (actual) = 600 board feet = 763.8 BF Brereton = 1.8 m ³ actual = 1.4 m ³ assumed
1 cubic meter	= 35.32 ft ³ = 424 board feet = 333 board feet Hoppus tons = 0.555 Hoppus Tons
1 MBF Brereton	= 2.36 m ³ = 785.4 board feet Hoppus
1 MBF Hoppus	= 1273 board feet-Brereton
MBF	= Thousand board feet
1 Super Foot	= 1 board foot
100 Super Feet	= 1000 board foot = 0.236 m ³
600 Super Feet	= 50 ft ³
1 lb/ft ³	= 16.0185 kg/m ³

CUBIC FEET OF SOLID WOOD PER CORD

Length of Sticks-Ft.	Diameter at Small End		
	1"-2.5"	2.5"-5.5"	Over 5.5"
2	65	84	91
4	64	82	89
8	59	77	84
12	54	71	78

RULE OF THUMB CONVERSIONS

1 c. unit of wood	= 1.117 cords = 1.25 units of chips = 250 ft ³ of chips = 7.08 m ³
1 cord of wood	= 85 ft ³ of solid wood = 1.06 units of chips = 2.41 m ³
1 unit of chips	= 80 ft ³ of solid wood = 2.27 m ³
1 cord of wood	= 500 board feet = 1.18 m ³
2000 pounds of chips	= 500 pounds of pulp
1 cord	= 212 ft ³ of chips = 6 m ³

PRODUCT LINE DESCRIPTION

Linking underground and surface mining operations, the Cat® Highwall Mining System is a low cost solution for mining coal. The HW300 offers a safe and innovative method for extracting coal from exposed seams in a multitude of applications.

HW300 FEATURES

- **Maximum Extraction** — Low cost coal to traditional mining methods.
- **Safe Operation** — The entire mining cycle is completed by a three- or four-man crew, with no personnel going underground at any time.
- **Excellent Mobility** — The highwall miner trams easily from entry to entry and discharges coal in tight spaces.
- **Operator Comfort** — The air-conditioned cab offers an ergonomic workplace where all controls are within the operator's reach.
- **Easy Equipment Relocation** — The highwall mining system can be taken apart in modules — sized for transport using regular public roads.
- **Cutter Module Choices** — Caterpillar offers four different cutter modules for the Highwall Miner: extra low seam, low seam, mid seam and high seam.

NOTE: The low and extra low seam cutter modules are not available in some regions.

HIGHWALL MINING METHOD

Feasibility Determination

Highwall mining can produce exceptionally low cost coal if conditions are right. Having the right geology and environmental conditions is the key to success. Caterpillar and its dealers can assist you with an in depth evaluation of the site. For a very high-level evaluation, you can start by going to the Highwall Miner page on www.cat.com and use the on-line site evaluation tool.

Extracting Coal Affordably and Safely

Highwall mining is a proven and versatile primary method for mining coal from exposed seams.

The Cat HW300 highwall miner stands on the pit floor or on a bench, directly in front of the exposed seam and makes long parallel rectangular drives into the coal seam. Pillars of material are left in place between the entries to support the over burden.

A remote-operated cutter module is pushed up to 300 m (1000 ft) into the seam by a string of push beams (unmanned coal-conveying elements) that transport the mined coal back to the entry of the drive onto a stockpile. The whole mining cycle is completed by a three- or four-man crew, with no personnel going underground at any time.

The self-contained and self propelled Cat highwall mining system offers an innovative method for extracting coal from exposed seams in a multitude of applications.

Whether you're operating a trench, open cast or contour mine, the Cat highwall mining system can extract coal affordably and safely:

- **Open Cast** — Highwall mining is used to mine coal from underneath the final highwall, when the strip limit is reached due to economic reasons or surface conditions.
- **Trench Mining** — The unit mines coal from both sides of a purpose-prepared trench; this mining method is used when an open pit is not an option.
- **Contour Mining** — In a mountainous area, the Cat highwall mining system can follow a coal seam along the side of the hill.

HIGHWALL MINER APPLICATIONS

- ① **Open Cast Pit Mining**
- ② **Trench Mining (mining seams on both sides)**
- ③ **Contour Mining**

CUTTER MODULE

Proven Cutter Module

Caterpillar offers four separate cutter modules for the HW300: extra low seam, low seam, mid seam and high seam.

Recommended Seam Heights

Extra Low Seam	711 to 1549.4 mm	28 to 61 in
Low Seam	762 to 1500 mm	30 to 59 in
Mid Seam	1200 to 3050 mm	47.2 to 120 in
High Seam	2400 to 4500 mm	94.5 to 177 in

The cutter modules are interchangeable and quickly attach to the power head assembly. The cutting cycle is fully automated, yet allows the operator to manually adjust the machine function using an ampere reading as the coal seam varies. This proven technology allows the cutter module to accurately follow the coal seam and produce a cleaner product.

Advanced Technology

For even more accurate directional mining operation, Caterpillar offers an optional solid-state, fiber-optic, gyro-based navigation and steering system. This provides operators with very precise cutter module location data in real time for enhanced cutter module steering and pillar width control.

An optional Gamma Detection system can be used to guide the cutter module through the coal seam, leaving predetermined amounts of coal in the roof and floor. This system also allows the mining of coal in soft roof and/or soft floor situations.

POWER HEAD

Heavy Duty Power Head Assembly

The power head drives the cutter module and push beam string forward using two hydraulically-powered sump cylinders with a 6.86 m (22.5 ft) stroke.

The pushing force of 133 tonnes (147 tons) propels the cutter module to a depth of 300 m (1000 ft) and the pulling force of 275 tonnes (303 tons) retracts it safely.

The new standard sump cylinders have higher sump-and retract forces.*

*Applies to international customers only. Not available in the USA.

MOBILITY

Improved Maneuverability in Tight Spaces

The Cat highwall mining system is an agile, self-propelled machine that operates on contour benches as narrow as 18 m (59 ft). It trams easily from entry to entry and discharges coal in tight spaces. An optional right-angle conveyor system discharges coal on the right or left side on narrow benches. It can also discharge onto a stacking conveyor system, where coal is moved to the center of the bench for stockpiling large volumes.

Four heavy-duty, hydraulically-powered tracks articulate independently in two operating modes — mine mode and tram mode — and can rotate the machine 360°, which improves maneuverability in congested areas. Mine mode is used for moving parallel to the highwall, while tram mode is used when moving from pit to pit.

OPERATOR COMFORT

Ergonomic Design for Comfort, Control and Productivity

The Cat highwall mining system is equipped with a comfortable, climate controlled, pressurized cab that offers a full view of the mining operation and the highwall. A full suspension seat and two adjustable touch-screen displays provide an ergonomic environment, placing machine controls and system information at the operator's fingertips.

PUSH BEAMS

Backbone of the Highwall Mining System

Cat push beams are 6 m (20 ft) long, rectangular, reinforced steel box structures joined together to form a string, which connects the highwall mining system to the cutter module.

The push beam string is the backbone of the machine; pushing and pulling the cutter module in and out of the coal seam.

The push beam conveys mined coal inside. The enclosed beam protects the coal from contamination and supports the hose chain that supplies control and power to the cutter module.

Other Cat push beam advantages include:

- A strong method of attachment that is secured and disengaged quickly
- A push beam connection that allows the string and cutter module to navigate through coal seam rolls and undulations
- A simple design free of electrical and hydraulic connections
- Push beams that can be stacked six high reducing storage area in narrow work sites, even under tough pushing and pulling conditions.

REEL AND CHAIN

Storage and Protection of Cables and Hoses

A steel-armored hose chain stores and protects all electric power cables, hydraulic and coolant lines, and the control cable to the cutter module. The hose chain is automatically unrolled and retracted on a reel during mining.

CONTROL SYSTEM

Control System with Diagnostics

The Cat highwall mining system's operation is controlled by a Programmable Logic Controller, which provides reliable performance for greater uptime. A comprehensive diagnostics system, including troubleshooting assistance, streamlines maintenance procedures.

Electric Controls

Motor Control Circuits (MCC) for the cutter module motors are housed on the surface in the Electrical Control Module (ECM). Underground electrical components are housed in flame-proof enclosures.

ANCHORING SYSTEM

Maximum Stabilization even under Toughest Conditions

Two drills mounted on the front of the machine are used to drill into the pit floor up to 2.4 m (8 ft). High-strength pins are then inserted through the base frame into the pit floor to help stabilize the machine and to maintain its accurate position, even under tough pushing and pulling conditions.

EQUIPMENT RELOCATION

Convenient Modularity for Quick Assembly

For quick relocation over long distances, the Cat highwall mining system can be taken apart in modules. Rapid disassembly and reassembly is facilitated by convenient hydraulic and electrical connectors, and all modules are sized for transport using regular public roads.

Depending on local conditions, the system can also be transported between sites and without disassembly by heavy haul trucks.

SAFETY

Designed with Safety as the First Priority

The Cat highwall mining system is engineered and equipped with a priority on safe operation; safety features include:

- **Elevated Cab with Cameras** — For a complete view of the highwall mining system and mining operation, the FOPS certified operator cabin is elevated on the machine and three magnetic base cameras are provided whose positions can be easily and quickly adjusted.
- **Above-ground Operation** — Operation of the system is performed entirely on the surface with no crew members working underground.
- **Small-crew Size** — The highwall mining system only requires a three- to four-person crew for full operation.
- **Remote Operation** — In an emergency, the machine can be operated remotely using a laptop from as far away as 61 m (200 ft).
- **Anchoring System** — Two drills mounted on the front of the machine are used to drill into the pit floor up to 2.4 m (8 ft). High-strength pins are then inserted through the base frame into the pit floor to help stabilize the machine and to maintain its accurate position, even under tough pushing and pulling conditions.

- **Methane Sensor** — A methane sensor is mounted near the cutter drum. When the methane content in the air reaches the warning level, an automatic warning signal attends the crew. When the methane level reaches a pre-set maximum level, a warning signal attends the crew, and all electric power to the cutter module is automatically disconnected (Except to the methane sensor itself). Settings depend on local regulations.
- **Working safely at night** is enhanced by a number of LED Flood lights, as well as LED platform and interior lights. The platform and interior lights are backed-up by a battery system to stay on for up to 10 minutes after a power outage.
- **Hydraulic Controls** — Underground hydraulic valves are provided with flame proof solenoids.

SUPPORT

Product Support

Parts and service support for the HW300 are never far away with the global Cat Dealer Network. You can count on our dealers' skill and knowledge for quality maintenance and high parts availability. Since the machine will be serviced on site, this requires a trained crew with a dedicated maintenance truck, stocked with essential spares and consumables for the machine. Your dealer is happy to discuss this and other support services options.

Training

Caterpillar can arrange operational and technical training which covers every aspect of the HW300 Highwall Miner.

Support Equipment

The highwall miner has the following support equipment needs:

1. Two wheel loaders; one to load push beams during mining, one to manage the coal stock pile.
2. A stacker belt is recommended for managing the coal as it comes off the machine.
3. Equipment requirements for keeping the seam exposed will depend on the application.

HW300 HIGHWALL MINING SYSTEM SPECIFICATIONS

Environmental and Operational Conditions

The Cat HW300 is designed for the following environmental and operating conditions:

Mine Application	<ul style="list-style-type: none"> • Trench Application • Open Pit Mining • Contour Mining
Ambient Temperature	<ul style="list-style-type: none"> • Standard Package (includes Tropical environment) –30° to +50° C (-22° to +122° F) • Arctic Package –40° to +50° C (-40° to +122° F) (change of hydraulic fluid required between seasons)
Pit Floor Gradient	• 8 degrees nominal in any direction, 10 degrees maximum in any direction for traveling
Maximum Seam Gradient	• 8 degrees down dip relative to horizontal (level side-to-side, pit floor prepared at 2 degrees)

Power and Consumption

Electric Power (Installed) 995/460 VAC, 50/90 Hz Mid/High Seam Cutter Module and Right Angle Discharge

Function	Qty	Volts	Power (ea)		Power (Total)	
			kW	hp	kW	hp
Cutting Motors 60 Hz	2	995	179	240	358	480
Cutting Motors 50 Hz	2	995	149	200	298	400
Gathering Motors 60 Hz	2	995	34	45	67	90
Gathering Motors 50 Hz	2	995	41	55	82	110
Power Head Auger Motors	2	995	373	500	746	1000

Stacking Conveyor Motor (Max) (Customer Equipment)	1	995	75	100	75	100
Cooling Fan Motors	6	460	1.5	2	9	12
Water Circulating Pump Motor	1	460	7	10	7	10
Hydraulic Oil Circulating Pump Motor	1	460	11	15	11	15
Water Spray Pump Motor	1	460	6	8	6	8
Total Connected Power 60 Hz	19				1651	2215
Total Connected Power 50 Hz	19				1607	2155

Power for the Miner

The miner can be powered from a utility grid or if being operated in remote areas, using a Cat generator set available from any Cat dealer.

The machine is provided with our 2250 kVA “Global Transformer,” which accepts the following standard power supply voltages (+ and – 5%):

60 Hz: 7.2 or 4.16 kV

50 Hz: 6.6 or 3.3 kV

Water Consumption

Water consumption for surface dust suppression during the mining operation is an average of 1000 L (**264 gal**) per hour (estimate).

HW300 HIGHWALL MINING SYSTEM SPECIFICATIONS

General Specifications

All dimensions and weights are approximate and depending on final specification.

Machine Dimensions while Mining	<ul style="list-style-type: none"> • Width: 11.7 m (38.5 ft) • Height: 8.7 m (28.7 ft) • Length: LPCM: 20.3 m (66.5 ft) Mid Seam CM: 21.3 m (70 ft)
Machine Dimensions while Tramming	<ul style="list-style-type: none"> • Width: 7.7 m (25.3 ft) Track Width • Height: 9.1 m (30 ft) • Length: LPCM: 20.3 m (66.5 ft) Mid Seam CM: 21.3 m (70 ft) • Minimum road width for overhanging structure: 9.2 m (30.1 ft) with right-angle conveyor removed.
Weight	<ul style="list-style-type: none"> • HWM without cutter head: 225 000 kg (495,665 lb) • Push Beam Weight: 5330 kg (11,750 lb) — 54 pieces (54 push beams are standard for a system)

6

Extra Low Seam Cutter Modules

The extra low seam cutter module is specifically designed to work with the Cat HW300

Cutter Drum Diameter	• 65 cm (25.5 in)
Cutting Width	• 294 cm (116 in)
Drum Drive	• (2) 123 kW (165 hp) /995 VAC/60 Hz Electric Motors
Maximum Cutting Height	• 154 cm (61 in)
(2) Hydraulic cylinders with integrated liner transducers to measure cutting height.	
Gathering System	• Coal gathered by augers

Low Seam Cutter Modules

The low profile cutter module is specifically designed to work with the Cat HW300

Cutter Drum Diameter	• 65 cm (25.5 in)
Cutting Width	• 2.95 m (116 in)
Drum Drive	• (2) 123 kW (165 hp) /995 VAC/60 Hz Electric Motors
Maximum Cutting Height	• 1.6 m (63 in)
(2) Hydraulic cylinders with integrated liner transducers to measure cutting height.	
Gathering System	• Coal gathered by augers

Mid Seam Cutter Modules

The mid cutter module is a Cat design that employs a CM235 Cutting Boom and gathering pan assembly.

Cutter Drum Diameter	• 965 mm (38 in)
Drum Width	• 3.5 m (11 ft 6 in)
Drum Drive	• (2) 175 kW (235 hp) /995 VAC/60 Hz
Gathering System	• CLA System

High Seam Cutter Modules

Cutter Drum Diameter	• 966 mm (38 in)
Cutting Width	• 3505 mm (138 in)
Minimum Recommended Seam Height	• 2400 mm (94.5 in)

Optional

Navigation and Steering*	<ul style="list-style-type: none"> • An internal navigation device can be mounted in the cutter module for accurate heading and tracking of the position of the cutter module. The cutter head direction is automatically controlled by two steering arms (1 x L, 1 x R). *Steering not available on extra low or low seam cutter modules.
Natural Gamma Sensor	<ul style="list-style-type: none"> • Natural gamma sensors can be mounted to the top and/or the bottom of the cutter module. These sensors enables the operator to leave coal on the roof and/or floor to improve the coal quality or to enhance roof support in weak strata conditions.

F Half Track Width	5185 mm	17.0 ft

HW300 OPTIONAL EQUIPMENT

Optional equipment may vary.
Consult your Cat dealer for details.

Right-Angle Discharge

- This feature discharges coal to the right or left of the machine.

Cat Push Beam Grapple

- For the 966H/K/M with Fusion coupler, the following packages are available:

489-5931 FORK, PUSH BEAM HANDLING (QC)

This is the push beam grapple. A fork with fixed tines and double hydraulic clamps to transport 1 push beam at a time. With Fusion coupler hooks.

314-3189 BUCKET-COAL, 3405 mm 6.70 m³ (134 in 8.75 yd³) (QC) Standard 6.7 m³ (8.75 yd³) coal bucket. With Fusion coupler hooks. Requires: Edge group 109-9213 to be ordered separately.

362-9276 BUCKET-GP, 3201 mm 4.20 m³ (126 in 5.5 yd³) (QC) Standard 4.2 m³ (5.5 yd³) GP bucket. With Fusion coupler hooks. Requires: Edge group 100-6669, or adapter group 229-6942, tip group 217-4896 (8×) and segment group 100-6667 to be ordered separately.

388-1946, 378-9993, 379-0000, 336-4973 or 379-0014 FORK, PALLET (QC) Standard Fusion pallet fork. Which tine length is to be decided by the customer.

Generator Set

- The Caterpillar Mining Power Module is a self contained power plant with on board diesel fuel tank for up to 8 hours of operation, built to ISO 12.2 m (40 ft) dimensions for ease of shipping.

SHIPPING DIMENSIONS KEYS

300.9 through 390F L

- A Cab height
 - B House width, without mirrors
 - C Track width, standard shoe
 - D Ground clearance, frame
 - E Ground clearance, counterweight
 - F Tail swing radius
 - G Overall track length
(grouser bar to grouser bar)
 - H Overall transport length
 - J Shipping height
 - K Length of track on ground
 - L Track gauge
-

M313D through M322F

- A Cab height
 - B Transport width
 - C Overall tire width
 - D Ground clearance, frame
 - E Transport length without boom
 - F Overall transport length
 - G Transport height
 - H Ground clearance, counterweight
 - J Tail swing radius
 - K Wheelbase length
 - L Overall width
(outrigger to outrigger)
-

EXCAVATOR LIFTING CAPACITY

On many sewer jobs an excavator must lift and swing heavy pipe and manboxes in and out of the trench, place manholes and unload material from trucks. In some situations the excavator’s lift requirements may be so critical that they determine the size excavator selected.

An excavator’s lift capacity depends on its weight, center of gravity, the lift point position (see sketches) and its hydraulic capability. An excavator’s lifting capability for any given lift position is limited by its tipping stability or hydraulic capacity.

Changes in boom, stick and bucket position affect attachment geometry and can drastically change a machine’s hydraulic lifting capacity. Caterpillar defines excavator lifting capabilities using the following SAE guidelines.

Tipping Conditions — An excavator is considered to be at the tipping point when the weight in the bucket acting at the center of gravity causes the rear rollers to lift clear of the track rails. Suspended loads are considered to be hung from the back of the excavator’s bucket or bucket linkage by a sling or chain. Weights of attachments, slings or auxiliary lifting devices are considered part of the suspended load.

Thus, the tipping load is defined as the load producing a tipping condition at a specified radius. The load radius shall be measured as the horizontal distance from the axis of upper structure rotation (before loading) to the center of vertical load line with load applied (dimension A, below). The rating height is based on the vertical distance of the bucket lift point to the ground (dimension B).

- A. Radius from swing centerline
- B. Bucket lift point height

HYPOTHETICAL MACHINE

Rated Hoist Load — The rated load is established using the vertical distance of the lifting point to the ground and the radius of load. Ratings for the ability of a specific machine attachment to lift a load slung from the designated bucket are defined as follows:

- a. The rated load will not exceed 75% of the tipping load.
- b. The rated load will not exceed 87% of the excavator’s hydraulic capacity. This means the machine should be able to lift 115% of the rated load.
- c. The rated load will not exceed the machine’s structural capability.

This drawing shows how an excavator's lifting capacity can vary with load position:

HYPOTHETICAL MACHINE

Tips for Lifting Above Ground:

Get the load as close to the excavator as possible.
 Use a cable short enough and position the excavator so as to put the load lift point in the “optimum lifting range” (see sketch).
Problem: Long reach cable — Can’t lift.
Solution: Shorten reach and cable — Can lift.

Tips for Lifting Below Grade:

Use a cable for sufficient length to position the load lift point in the “optimum lifting range”.
Problem: Short cable, deep trench — Can’t lift.
Solution: Lengthen cable to locate bucket hinge pin in optimum lifting area — Can lift.

GROUND LEVEL LIFTING CAPACITIES

The lifting capacities that are shown on the following pages are with the lifting point at ground level. These capacities are rated according to SAE Std. No. J1097.
 (For lifting capacities at other heights or with other tools, refer to current Specification Sheets.)

*Indicates that the load is limited by hydraulic lifting capacity rather than tipping load.

NOTE: Oscillating axle needs to be locked. Weight of all lifting accessories must be subtracted from the lifting capacities.

All lift capacities calculated and rated per ISO 10567:2007. Rated loads do not exceed 87% of hydraulic lift capacity or 75% of tipping load.

Lifting capacities are based on the machine standing on a firm uniform supporting surface. The load point is the center line of the bucket pivot mounting pin on the stick.

*Indicates that the load is limited by hydraulic lifting capacity rather than tipping load.

NOTE: Oscillating axle needs to be locked. Weight of all lifting accessories must be subtracted from the lifting capacities.

All lift capacities calculated and rated per ISO 10567:2007. Rated loads do not exceed 87% of hydraulic lift capacity or 75% of tipping load.

Lifting capacities are based on the machine standing on a firm uniform supporting surface. The load point is the center line of the bucket pivot mounting pin on the stick.

*Indicates that the load is limited by hydraulic lifting capacity rather than tipping load.

NOTE: Oscillating axle needs to be locked. Weight of all lifting accessories must be subtracted from the lifting capacities.

All lift capacities calculated and rated per ISO 10567:2007. Rated loads do not exceed 87% of hydraulic lift capacity or 75% of tipping load.

Lifting capacities are based on the machine standing on a firm uniform supporting surface. The load point is the center line of the bucket pivot mounting pin on the stick.

*Indicates that the load is limited by hydraulic lifting capacity rather than tipping load.

NOTE: Oscillating axle needs to be locked. Weight of all lifting accessories must be subtracted from the lifting capacities.

All lift capacities calculated and rated per ISO 10567:2007. Rated loads do not exceed 87% of hydraulic lift capacity or 75% of tipping load.

Lifting capacities are based on the machine standing on a firm uniform supporting surface. The load point is the center line of the bucket pivot mounting pin on the stick.

EXCAVATOR BUCKET CAPACITIES

Caterpillar rates excavator buckets to conform with both PCSA standard No. 3 and SAE standard J-296. Buckets are rated on both their struck and heaped capacities as follows:

Struck Capacity

Volume actually enclosed inside the outline of the sideplates and rear and front bucket enclosures without any consideration for any material supported or carried by the spillplate or bucket teeth.

Heaped Capacity

Volume in the bucket under the strike off plane plus the volume of the heaped material above the strike off plane, having an angle of repose of 1:1 without any consideration for any material supported or carried by the spillplate or bucket teeth.

The Committee on European Construction Equipment (CECE) rates heaped bucket pay loads on a 2:1 angle of repose for material above the strike off plane.

CURL AND CROWD FORCES

Bucket penetration into a material is achieved by the bucket curling force (F_B) and stick crowd force (F_S). Rated digging forces are the digging forces that can be exerted at the outermost cutting point. These forces can be calculated by applying working relief hydraulic pressure to the cylinder(s) providing the digging force. The digging forces listed on next page conform with SAE Standard J1179 and PCSA Standard No. 3. The values may not be directly comparable to forces for machines rated by other methods than those described below.

$$F_B = \text{Radial tooth force due to bucket cylinder} \\ = \frac{\text{Bucket cylinder force}}{\text{Arm D length}} \left(\frac{\text{Arm A} \times \text{Arm C}}{\text{Arm B}} \right)$$

$$\text{Cylinder force} = (\text{Pressure}) \times (\text{End area of cylinder head}) \\ \text{Arm D} = \text{Bucket tip radius}$$

Maximum radial tooth force due to bucket cylinder (bucket curling force) is the digging force generated by the bucket cylinder(s) and tangent to the arc of radius D' . The bucket shall be positioned to obtain maximum output moment from the bucket cylinder(s) and connecting linkages. When calculating, maximum F_B occurs when the factor — Arm A times Arm C divided by Arm B — becomes the maximum.

$$F_S = \text{Radial tooth force due to stick cylinder} \\ = \frac{(\text{Stick cylinder force}) \times (\text{Arm E length})}{(\text{Arm F length})}$$

$$\text{Arm F} = \text{Bucket tip radius} + \text{stick length}$$

Maximum radial tooth force due to stick cylinder (stick crowd force) is the digging force generated by the stick cylinder(s) and tangent to the arc of radius F. The stick shall be positioned to obtain the maximum output moment from the arm cylinder and the bucket positioned as described in the bucket force rating. When calculating, maximum F_S occurs when the axis in the stick cylinder working direction is at a right angle to the line connecting the stick cylinder pin and the boom nose pin.

**Bucket Selection Considering
Bucket Curl and Stick Crowd Forces**

The combination of the excavator's stick crowd force and bucket curling force give this machine configuration more effective bucket penetration force per mm (inch) of bucket cutting edge than is available with other machine types such as wheel and track loaders.

As a result of high penetration force, an excavator bucket is comparatively easy to load. Also, the higher unit breakout forces allow the excavator's economic application range to be extended farther into the tougher soils (coral, caliche, shale, limestone) before blasting or ripping is required.

To take full advantage of an excavator's high penetration forces, buckets should be selected so they are well matched to soil conditions that are encountered. The two important things to consider are bucket width and bucket tip radius.

As a general rule, wide buckets are used in easily dug soil and narrow buckets in harder material. In hard rocky soils, tip radius also has to be considered in bucket selection. Because the shorter tip radius buckets provide more total bucket curling force than the long tip radius buckets, they are generally the easiest to load. A good rule of thumb when selecting a Cat bucket for hard material is to choose the narrowest bucket that has a short tip radius.

Other factors such as trench bottom width specifications, manbox size, or the desire to conserve bedding material may also influence excavator bucket selection.

NOTE: See the following pages for listing of Cat buckets by tip radius and cutting edge width.

Caterpillar offers a very comprehensive list of high strength steel buckets. High strength steel allows thinner components which helps keep the weight down, maintains durability and improves loadability. The wrong bucket can reduce production 30-40% or more. Caterpillar's in-depth knowledge of machine design, bucket design

and application experience allows offering **machine matched** packages that optimize performance.

Additional buckets may be available and the listed buckets may not be available in all sales areas. Contact your Cat dealer for your specific bucket needs.

NEW NOMENCLATURE FOR HYDRAULIC EXCAVATOR BUCKETS

Caterpillar will soon be moving to a new global nomenclature for buckets on small, medium and large HEX machines and associated linkages. The end result will be a manageable, consistent bucket offering in all regions regardless of where the machine or bucket may be built and shipped. The new bucket designs and nomenclature will be introduced over the next several years, as D and E Series HEX machines are introduced.

Why the change?

Consistent product line

Buckets currently sold into different regions of the world have been designed and manufactured independent of each other resulting in different bucket styles and nomenclature. As Caterpillar becomes more global, we recognize this can lead to confusion in the marketplace as machines and buckets are sourced from different areas.

Improved bucket selection

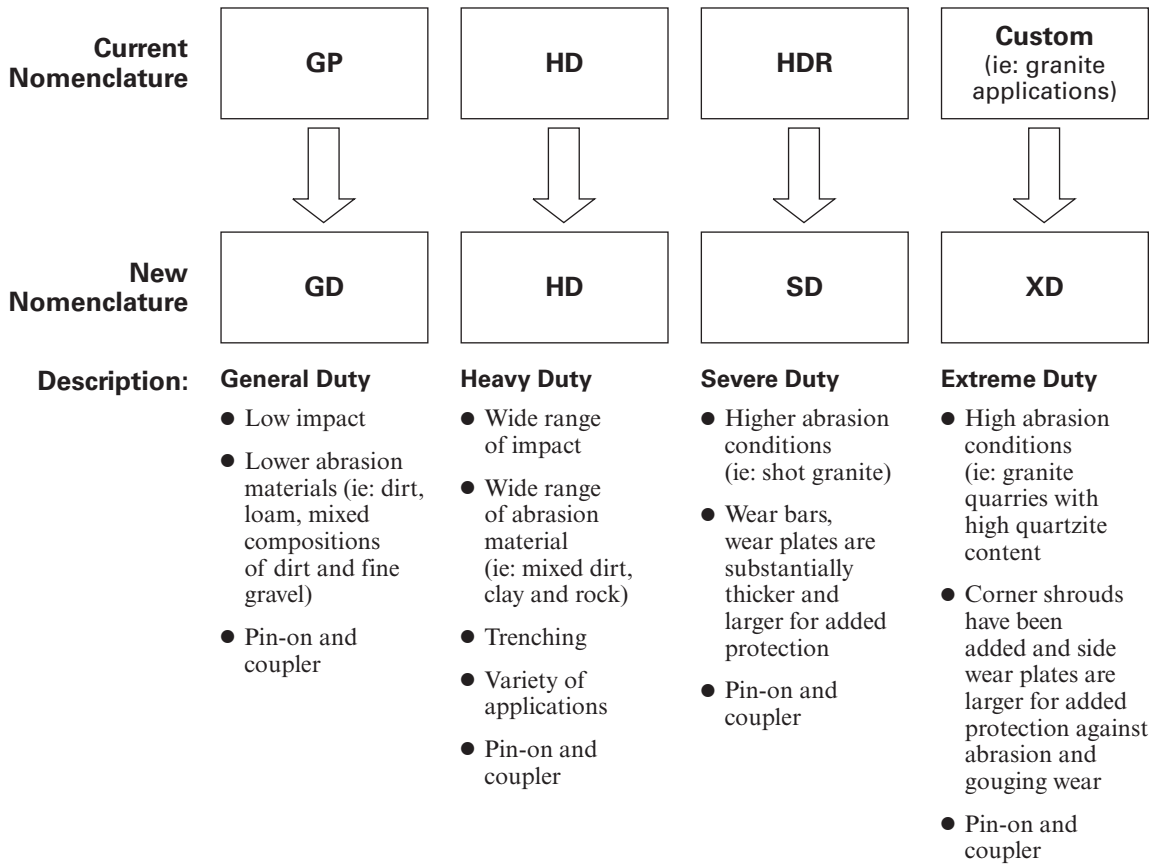

Caterpillar continues to recognize the need for a range of buckets for various applications and with varying durability requirements — from site development to granite quarries. The new, global nomenclature is simplified, consistent, and based on the durability of the bucket. These considerations allow a clear and consistent bucket positioning to help facilitate appropriate bucket selection and recommendation — and put Caterpillar in a better position to support machines on a global scale.

Dealers and customers in North America will see changes in bucket nomenclature and improvement in bucket designs.

What dealers will see with the change

Today, North American HEX buckets are grouped into three main categories: General Purpose (GP), Heavy Duty (HD), and Heavy Duty Rock (HDR). New nomenclature brings in four primary categories, each represent durability. They are: General Duty (GD), Heavy Duty (HD), Severe Duty (SD), and Extreme Duty (XD). Within the Extreme Duty class a new bucket specific for use in granite will be available for the large excavators.

The diagram below illustrates how today's nomenclature aligns with the new, followed by a brief description of each category.

BUCKET TYPES

General Duty

For digging in low impact, lower abrasion materials such as dirt, loam, and mixed compositions of dirt and fine gravel. Example: Digging conditions in which General Duty tip life exceeds 800 hours.

Typically larger General Duty buckets are the most popular sizes, and are used by site developers to mass excavate in low abrasion applications.

- Lighter structures decrease load time and increase the weight that can be lifted.
- Standard size adapters and tips.
- Sidebars are pre-drilled for optional sidecutters and sidebar protectors.

Heavy Duty

The most popular excavator bucket style. A good “center line” choice, or starting point, when application conditions are not well known.

For a wide range of impact and abrasion conditions including mixed dirt, clay and rock. Example: Digging conditions where Penetration Plus tip life ranges from 400 to 800 hours.

Heavy Duty Buckets are recommended for trenching in utilities work, and for the general contractor working in a variety of different situations.

- Thicker bottom and side wear plates than General Duty buckets for more durability.
- Adapters and tips are up-sized for enhanced performance and durability.
- Sidebars are pre-drilled for optional sidecutters and sidebar protectors.

Severe Duty

For higher abrasion conditions such as well shot granite and caliche. Example: Digging conditions where tip life ranges from 200 to 400 hours with Penetration Plus tips.

- Bottom wear plates are about 50% thicker than Heavy Duty buckets.
- Side wear plates are about 40% larger than Heavy Duty buckets for added protection against abrasive and gouging wear.
- Heavy Duty and Severe Duty buckets use same size adapters.
- Adapters are sized to accommodate higher abrasion conditions.
- Tips are up-sized (over the General Duty bucket) for enhanced performance and durability.
- Sidebars are pre-drilled for optional sidecutters and sidebar protectors.

Extreme Duty

For very high abrasion conditions including high quartzite granite. Example: Digging conditions where tip life is less than or equal to 200 hours with Extra Duty tips.

- Corner (or heel) shrouds, Base Edge End Protectors (BEEPs), base edge segments, liners, and Mechanically Attached Wear Plates (MAWPs) protect the bucket from wear.
- Side wear plates are larger.
- Sidebar protection has been added for protection against abrasion and gouging wear.
- Adapters are sized to accommodate higher abrasion conditions.
- Tips are up-sized (over the General Duty bucket) for enhanced performance and durability.

Special Purpose Buckets

Caterpillar offers a range of special purpose buckets, variants of the durabilities listed above, to meet particular application needs.

Ditch Cleaning

These buckets are designed for cleaning ditches, sloping, grading and other finish work. Their shallow depth and compact size make working in confined areas easier. Drainage holes allow liquid to empty so material dumps more easily.

Ditch Cleaning Tilt

Tilt Buckets feature a full 45° of tilt in each direction, powered by two double-acting cylinders. Ditch Cleaning and Tilt Buckets are available for 311-336 excavators.

Center-Lock™ Pin Grabber Performance

This bucket is designed with a patented recessed pin to provide maximum digging performance while keeping the versatility and convenience of a coupler. Tip radius is reduced and allows up to 10% improvement in breakout force when compared to a conventional pin-on Bucket and Coupler combination.

Center-Lock Performance Buckets are available for 315-345 excavators, in General Duty, Heavy Duty and Severe Duty durabilities.

Power

Power Buckets are for use in abrasive applications where breakout force and cycle times are critical — and for use in materials such as tightly compacted mixed dirt and rock. (Not recommended for clay.) Breakout force is maximized due to decreased tip radius and increased pin spread. Machine cycle times in most material is improved over a standard bucket in a similar application. Heavy Duty Power Buckets are available for 320-336 excavators.

Wide Tip

Wide Tip Buckets are intended to perform best in low-impact materials such as dirt and loam where leaving a smoother floor and minimal spillage is necessary. The bucket is engineered to be used exclusively with Cat Wide Tips. Corner adapters face straight forward to create a smooth edge. General Purpose Wide Tip Buckets are available in widths from 24" to 78" for 311-345 excavators.

High Capacity

High Capacity Buckets are designed and built for use in high production truck loading applications. With proper application and set up, these buckets will move more material in a minimal amount of passes — maximizing production. High Capacity Buckets are available for 349-390 excavators, in General Duty durability.

BUCKET SALES SUPPORT

The latest sales literature for HEX Buckets worldwide can be found in Work Tool Central at <https://dealer.cat.com/products/wtc>.

- HEX Bucket Specalog (NACD) — GEHQ0201
- 374D Buckets Product Bulletin — GEJQ0231

BUCKET PAYLOAD

An excavator's bucket payload (actual amount of material in the bucket on each digging cycle) is dependent on bucket size, shape, curl force, and certain soil characteristics, i.e., the fill factor for that soil. Fill factors for several types of material are listed below.

$$\text{Average Bucket Payload} = (\text{Heaped Bucket Capacity}) \times (\text{Bucket Fill Factor})$$

Material	Fill Factor Range (Percent of heaped bucket capacity)
Moist Loam or Sandy Clay	A — 100-110%
Sand and Gravel	B — 95-110%
Hard, Tough Clay	C — 80-90%
Rock — Well Blasted	60-75%
Rock — Poorly Blasted	40-50%

Working Weights — Bucket & Payload

The following tables give maximum “bucket plus payload” weights to assist in selecting the correct bucket for a specific application. These weights are based on actual job conditions. In better than average conditions the excavator may be able to achieve rated lift capacities listed in this section.

NOTE: Bucket sizes are suitable for a maximum material density of 1800 kg/m³ (3035 lb/yd³). Payloads shown are calculated at 1500 kg/m³ (2530 lb/yd³).

Long Reach

- Introduction
- Range Dimensions
- Bucket Information

INTRODUCTION

Long reach excavators are designed purposely for light duty digging that requires reach capability well above that of normal digging machines. To be able to have high enough digging forces together with an acceptable size bucket, the long reach excavators have a smaller digging envelope than the ditch cleaning machines. Long reach excavators are ideally suited for deep digging in gravel or sand pits then feeding directly into a hopper.

Caterpillar's long reach hydraulic excavators use purpose-built booms and sticks designed by Caterpillar for maximum performance and durability in light duty applications.

Long Reach Excavation Fronts include: boom, stick, linkage cylinders (boom, stick, and bucket), hydraulic lines, additional counterweight for stability over the side and heavy duty wide undercarriage. Dimensions include light excavation bucket.

- Bucket Information

INTRODUCTION

Long Reach Excavation machines are designed specifically for jobs requiring longer reach than standard excavators, combined with digging capabilities.

The boom and the stick are purposely designed to perform digging operations with an acceptable bucket size.

The performances of the machine are attained through the use of bigger boom cylinders, heavy-duty wide undercarriage and significant additional counterweight. A heavy-duty upper-frame is also used in order to guarantee durability and resistance to the extra stresses generated by that demanding application.

Long Reach Excavation machines are ideally suited for deep or long distance digging in sand or gravel pits, slope forming, cleaning of settling banks, river conservation and other work formerly reserved for draglines.

These excavators can of course feed directly into a hopper or load a truck that would stand by their side.

The boom and the stick are designed following Caterpillar's standards, in order to provide the maximum performance and durability in digging applications.

Long Reach Excavation Fronts include: boom, stick, linkage (boom, stick, and bucket cylinders), hydraulic lines and additional counterweight.

Dimensions include the bucket.

Hydraulic Excavators

Super Long Reach

- Introduction
- Range Dimensions
- Bucket Information

INTRODUCTION

Super long reach excavators are designed specifically for those jobs requiring maximum reach well beyond the range of normal excavators. Those machines are designed to drag a small bucket at about 90 degrees over the side of the tracks towards the excavator; they are not suited for digging work. Caterpillar offers the Long Reach excavators for light digging applications with a much larger digging envelope than normal excavators. Super long reach excavators are suited for ditch cleaning, slope finishing, river conservation and other work formerly reserved to draglines.

Caterpillar's super long reach hydraulic excavators use purpose-built booms and sticks designed by Caterpillar for maximum performance and durability in dragging applications.

Super long reach fronts include: boom, stick, linkage cylinders (boom, stick, and bucket), hydraulic lines and additional counterweight for stability while working over the side. Dimensions include bucket.

- Tracks vs. Wheels
- Stick/Bucket Combinations

MACHINE SELECTION: TRACKS VERSUS WHEELS

Features:

Tracks

- Flotation
- Traction
- Maneuverability
- Severe underfoot
- Faster machine repositioning

Wheels

- Mobility and speed
- No pavement damage
- Better stability with outriggers or dozers
- Leveling machine with outriggers
- Dozing capability

307–385

Unless the application calls for a lot of travel to, from, and around the job sites, a track-type excavator could be the better choice. Track-type excavators provide good traction and flotation in almost all kinds of underfoot conditions. Consistently good drawbar power provides excellent maneuverability. The tracked undercarriage also provides good overall stability. If the job calls for frequent machine repositioning, a track-type excavator will provide better operating efficiency — where raising and lowering outriggers would take extra time.

Wheels (M313D–M322D)

Looking for a highly versatile machine? A machine that can do more than mass excavation and trenching. Consider a Wheel Excavator.

A Wheel Excavator combines traditional excavator features such as 360° swing, long reach, deep digging depth, high loading height, high digging forces and high lift capacities, with the mobility of a wheeled undercarriage. The rubber tires allow the excavator to travel paved

roads, work in shopping malls, squares, parking lots and other paved areas without damaging the pavement. It's mobility allows fast independent travel between job sites as well as on the job site giving you more job planning flexibility. The Wheel Excavator is the ideal tool for truck loading in tight quarters, undercutting concrete or asphalt, patching, shoulder work, curb and gutter repair, landscaping, spreading top soil, fine grading, laying pipe, placing manholes or ditch cleaning.

A Wheel Excavator is also an ideal machine in material handling. It can load or unload trucks and carry loads around the job site. Stabilizers and a dozer blade can be pinned to the undercarriage increasing the machines stability during lifting.

Equip the Wheel Excavator with dedicated special attachments such as cab riser, material handling stick and boom. Add the additional hydraulic circuit option and your ready for a complete range of special tools. Ditch cleaning bucket, clamshell, grapples, hammers to name a few.

Cat Wheel Excavators offer a load independent, load-sensing, flow distribution hydraulic system that gives the operator absolute precision and control no matter what the application.

Machine weight is the key to selecting a Wheel Excavator. Following are some additional factors that need to be considered.

Choose the proper boom and stick for your reach, digging depth and lifting requirements. Stability can be greatly enhanced by adding outriggers and/or a dozer blade. Additional hydraulic circuits can be added depending on your application and stick end attachments.

Acceptable Bucket/Stick Combinations

The following charts identify the acceptable bucket and stick combinations for Cat Wheel Excavators and are based on stability. Minimum stability occurs with the linkage oriented over the side and positioned as shown in the visual. Dozer and/or stabilizers (if equipped) are raised and the bucket contains a full load. The longest stick is shown that has acceptable stability for each bucket. That stability is 1.1 moment ratio or better. Once this stability factor is established, all shorter sticks are then acceptable with the listed bucket.

EXCAVATOR SHOE SELECTION

Undercarriage life can be extended by equipping the machine properly for the application.

Many excavators work on pavement or flat, soft ground and experience few undercarriage problems. But if those same machines (usually equipped with wide track pads) were placed in severe underfoot conditions, undercarriage destruction could occur very rapidly.

The rule, used for other track-type machines — “*Whenever possible use the narrowest shoes available*” — is even more valid for excavators.

The best general purpose track shoe is the triple grouser. It has a good section modulus and offers the best compromise between traction and minimum disturbance to paved surface.

The double grouser shoe has a better section modulus and is more aggressive than the triple grouser section. Single grouser shoes are offered for maximum traction. Some users like single grousers for added mobility in hilly terrain.

The following table lists ground pressures for various width shoes (reach boom, medium stick and bucket):

Model	Shoe Type	Shoe Width		Pressure

QUICK COUPLER SYSTEMS

Quick couplers can greatly increase a machine's versatility and productivity. They make it much easier to switch attachments which can increase utilization. Quick couplers also encourage changing buckets when the application changes, rather than continue to use a less efficient bucket. Example: An application that is predominately dirt with occasional pockets or seams of rock. Without a quick coupler the owner may choose to live with a rock bucket but, rock buckets are normally smaller and heavier which reduces performance in a dirt application. A quick coupler allows the use of the rock bucket in the rock and a GP bucket in the dirt.

Caterpillar offers two main types of quick couplers. The first is a dedicated type. A typical system substitutes hooks on the bucket for the pin-on hinges used with conventional buckets. The mating portion is pinned on the stick and bucket linkage. It slips into the hooks to secure the bucket or other attachment.

**Dedicated
Hook-type**

Advantages:

Bucket tip radius (distance from the bucket pivot point to the bucket tip) does not increase. Increased tip radius reduces curl and stick forces which can reduce the loadability of the bucket. The hook type coupler also does not add appreciable weight at the end of the stick. Keeping the tip radius and weight the same ensure no compromise in performance. The machine portion of the hook type coupler can be designed to allow more than one machine to use the same buckets.

Disadvantages:

The hook type system requires special buckets. Conventional pin-on buckets cannot be used. The ability to use buckets on more than one machine requires careful application analysis. Larger machines generate forces that can destroy the wrong buckets. Smaller machines with the wrong bucket may develop loads in excess of the machine's capability. Even if the machine can handle the loads, the tip radius may be too large to allow the bucket to load properly. With the flexibility of a quick coupler comes the responsibility to make sure the bucket or other attachments are properly sized for each application.

The second type of quick coupler is the pin grabber type. This device pins on the stick and bucket linkage and grabs the bucket pins on standard pin-on buckets.

Pin Grabber

Advantages:

The advantage of the pin grabber is that it will pick up standard pin-on buckets. No need to purchase new attachments that will fit the system.

Disadvantages:

The pin grabber is mounted between the stick and the bucket which increases the tip radius. The amount of increase depends on the pin grabber's manufacturer. Increasing tip radius can compromise performance by decreasing bucket forces. The coupler also adds weight and reduces the payload capability.

Pin grabbers are required to mate up with existing bucket pins. Because different machines require different pin spreads and diameters, they offer very limited ability to match with buckets from other machines.

Both types of quick couplers offer cab activated ... this allows an attachment change in 30 seconds or less.

MINI HYDRAULIC EXCAVATORS

Dual Lock Pin Grabber Couplers

Dual Lock Pin Grabber Couplers allow work tools to be changed quickly — improving overall production and increasing machine versatility. A coupler is pinned on in place of the bucket with standard pins.

The **Dual Lock Coupler** is available in a standard pin grabber design for use on machines sized from 301.4C-308E2 CR SB. There are two types of Dual Lock Pin Grabber Couplers – Mechanical and Hydraulic (fully operable from the cab).

The **Dual Lock Tilt Coupler** allows for 180° of rotation while providing a reliable high torque actuator with few moving parts. The 180° rotation reduces the need for additional equipment on the job site, while increasing productivity and profitability.

Visible Secondary Lock

Cat Dual Lock Pin Grabber Couplers maintain a tight fit throughout the life of the coupler with an innovative wedge design. Primary and secondary locking systems are totally independent. The primary locking system consists of a locking wedge mechanism. An anti-rotation locking system into the actuator for the primary locking wedge is automatic and ensures the primary lock remains fully engaged even when used with high energy vibratory tools.

The secondary locking system incorporates a spring-loaded rotating lock that automatically locks on the front pin on the work tool during coupling. Spring applied, hydraulically released on the hydraulic coupler, and spring applied, mechanically released on the mechanical coupler.

Dual Lock Couplers were designed with the operator in mind allowing the secondary lock to be clearly visible from the cab.

Productivity

As with any quick coupler, the Dual Lock quickly changes between attachments, allowing one machine to be used for multiple tasks on the job site. The ability to see when the coupler is open or closed makes it intuitive to use, saving time when changing tools.

Dual Lock Couplers can engage and disengage any compatible Cat bucket or work tool attachment equipped with pins. The pin grabber design allows for buckets to be turned around in “front shovel” mode on both the Dual Lock and the Dual Lock Tilt Coupler.

The ease of operation and quickness of tool change-over maximizes productivity on the job site. The coupler is easy to operate, regardless of user skill level, and it's easier to train new operators to use. The ability to see when the coupler is open and closed saves time whenever a tool is changed. The elimination of the locking bar allows for operation regardless of boom, stick and machine position.

Dual Lock Pin Grabber Couplers meet Australian Standard AS 4772 and European EN-474-1.

Pin grabber couplers allow work tools to be changed quickly — improving overall production and increasing machine versatility. A coupler is pinned on in place of the bucket with standard pins, and can be easily removed should the need arise to mount a tool directly to the stick.

The Pin Grabber Coupler is designed for use on machines sized from 311-385 — and is designed to engage and disengage the same range of work tools as previous pin grabber couplers.

No dimensional or interface changes have been made to this coupler. However, a new patent-pending concept in the locking mechanism inside Center-Lock brings many benefits to the operator.

Compliant

The Cat Pin Grabber Coupler gives operators confidence through its patent pending locking system and visible locking mechanism. Couplers meet or exceed latest EN and ISO safety standards: EN474 and ISO/DIS 13031.

Visible Secondary Lock

The Pin Grabber Coupler was designed with the operator in mind. The secondary lock is clearly visible from the cab, providing an obvious indicator of coupler status: open or closed. The ability to see the lock on the front pin give the operator confidence and makes changing tools faster, while giving everyone on the job site reassurance that the Pin Grabber is locked tight.

Job Site Confidence

From engagement, all while working, to the time the attachment is disengaged, you can be completely confident attachments are connected properly.

From the operator's seat, visual and audible indicators help assure attachment is coupled. Your Cat excavator hydraulics, mechanisms inside the coupler, along with digging forces assure the attachment operates as expected.

The Cat Pin Grabber Coupler meets and exceeds safety standards allowing you to work anywhere in the world.

Productivity

As with any quick coupler, the Pin Grabber changes between attachments in seconds, allowing one machine to be used for multiple tasks on the job site.

The ease of operation and quickness of tool change-over maximizes productivity on the job site. The coupler is easy to operate, regardless of user skill level, and it's easier to train new operators to use. The ability to see when the coupler is open and closed saves time whenever a tool is changed. The elimination of the locking bar allows for operation regardless of boom, stick and machine position.

The Pin Grabber Coupler can pick up many buckets in reverse "front shovel" position for better control in utility work and precise digging and grading operations. Many competitive buckets can be engaged, making the Cat Pin Grabber invaluable in mixed fleets or rental fleets.

The Cat CW quick coupler can pick up any work tool and is equipped with a wedge-style locking system minimizing break-out force loss. The CW is highly suitable for harsh applications, such as demolition and quarries. The CW has become the industry standard in EAME. It is interchangeable with different machine classes, and has been designed for use with more than 700 different machines, both Cat and non Cat.

The Cat CW Series is available in a spindle and hydraulic version. A spindle version can easily be modified into a hydraulic version and vice versa.

Additional Benefit:

Hoisting hooks — To make the CW Series more versatile, hoisting hooks are available from 2 metric tons (2.2 tons) up to 20 metric tons (22 tons) capacity for maximum lifting capacity.

Auto-Connect Quick Coupler

The Auto-Connect quick coupler automates tool exchange fully, so operators can change work tools quickly, from the safety and comfort of their cabs. Tool changes become a matter of seconds. Built on the field proven quick coupler CW platform, the unique design of the Auto-Connect prevents ruptured hoses and oil spills, avoiding unplanned downtime.

Full Contamination Control on Both Quick Coupler and Work Tool:

A sliding cover keeps any dust and debris away from the hydraulic area, protecting the fluid connectors when not in use. Seals on both the Quick Coupler and the work tool cover have been included to close the gap with the cartridges, ensuring full contamination control. Rigid work tools without hydraulics, like buckets, do not need conversion to be picked up by the Auto-Connect quick coupler, avoiding unnecessary expenses. Due to the location of the hydraulic coupling unit, it's protected against damage from outside.

Plug-and-Perform System:

Auto-Connect is a “plug-and-perform” system based on Caterpillar’s dedicated CW platform, and fits directly to the machine and existing controls. The Auto-Connect is controlled via the Quick coupler actuation circuit. Combined with Cat Tool Control, it’s really easy for operators to select tools and make fast changeovers. With features like Auto Depressurization as standard no additional hydraulic components are required.

RIPPING & LOADING IN QUARRIES

The “Rip & Load” concept includes a large mass excavator equipped with a hydraulic quick coupler, a rock bucket and a ripper tine. The ripper tine is used to disrupt the in-situ rock formation, after which same excavator switches to the bucket to load the rock. This system is used where economical, environmental or legal issues prevent or restrict the use of explosives. In these situations, depending on geology, ripping either reduces the amount of explosives necessary, or replaces explosives all together.

Advantages:

- Reduction or elimination of blasting costs.
- Reduced safety risks.
- Smaller environmental impact (less noise and vibrations).
- Less exposure to precipitation, resulting in less water damage.
- Less waste (up to 35% reduction).
- Less internal cracks, resulting in higher quality product.
- Work areas can be closer to existing infrastructures.
- Fewer machines and personnel.
- Increased versatility with quick coupler (different buckets, hammers).
- Lower Cost per Ton.

Rip and Load Hourly Production

(With Hydraulic Quick Coupler)

Model	Metric Tons/Hour	Short Tons/Hour
345C/345D	150 - 300	165 - 330
365C	200 - 400	220 - 440
385C	300 - 500	330 - 550
5110B	400 - 600	440 - 660
5130B	600 - 800	660 - 880

Rippability

Refer to “Tip Selection”, “Estimating Ripping Production” and “Use of Seismic Velocity Charts” in the Track-type Tractors section. This information generally applies to usage of a ripper tine on the mass excavator.

Rippability Comparison between LHEX and LTTT

The excavator ripping technique is different from production ripping with a track-type tractor. The track-type tractor pulls the ripper(s) through the rock mass at a constant rate, whereas the excavator uses its stick-and curl forces to break material away from a horizontal or vertical face. Forward visibility in the excavator allows the operator to position the ripper tooth and attack geological discontinuities to assist the ripping process.

In ripping and loading, the ripper is typically used between 15% and 20% of the hour preparing the material. Tool change time, when using the hydraulic quick coupler, is insignificant with 2% to 6%. The remainder of the time is used for loading.

The ripping process improves bucket penetration which will increase service life of the bucket.

CYCLE TIME ESTIMATING CHARTS

The digging cycle of the excavator is composed of four segments:

1. Load Bucket
2. Swing Loaded
3. Dump Bucket
4. Swing Empty

Total excavator cycle time is dependent on machine size (small machines can cycle faster than large machines) and job conditions. With excellent job conditions the excavator can cycle fast. As job conditions become more severe (tougher digging, deeper trench, more obstacles, etc.), the excavator slows down accordingly. As the soil gets harder to dig, it takes longer to fill the bucket. As the trench gets deeper and the spoil pile larger, the bucket has to travel farther and the upper structure has to swing farther on each digging cycle.

Spoil pile or truck location also affects cycle time. If a truck is located on the floor of the excavation beside material being moved, 10 to 17 second cycles are practical. The other extreme would be a truck or spoil pile located above the excavator 180° from the excavation.

In sewer construction work the operator may not be able to work at full speed because he has to dig around existing utilities, load the bucket inside a trench shield, or avoid people working in the area.

The Cycle Time Estimating Chart outlines the range of total cycle time that can be expected as job conditions range from excellent to severe. Many variables affect how fast the excavator is able to work. The chart defines the range of cycle times frequently experienced with a machine and provides a guide to what is an “easy” or a “hard” job. The estimator can then evaluate the conditions of his job and use the Cycle Time Estimating Chart to select the appropriate working range. A practical method of further calibrating the Cycle Time Estimating Chart is to observe excavators working in the field and correlate measured cycle times to job conditions, operator ability, etc.

The following table breaks down what experience has shown to be typical Cat excavator cycle times with

- no obstruction in the right of way
- above average job conditions
- an operator of average ability and
- 60°-90° swing angle.

These times would decrease as job conditions or operator ability improved and would get slower as conditions become less favorable.

CYCLE TIME -vs- JOB CONDITION DESCRIPTION

Fastest Possible

Fastest Practical

Typical Range

Slow

KEY

- A — Excellent
- B — Above Average
- C — Average
- D — Below Average
- E — Severe

- Easy digging (unpacked earth, sand gravel, ditch cleaning, etc.). Digging to less than 40% of machine’s maximum depth capability. Swing angle less than 30°. Dump onto spoil pile or truck in excavation. No obstructions. Good operator.
- Medium digging (packed earth, tough dry clay, soil with less than 25% rock content). Depth to 50% of machine’s maximum capability. Swing angle to 60°. Large dump target. Few obstructions.
- Medium to hard digging (hard packed soil with up to 50% rock content). Depth to 70% of machine’s maximum capability. Swing angle to 90°. Loading trucks with truck spotted close to excavator.
- Hard digging (shot rock or tough soil with up to 75% rock content). Depth to 90% of machine’s maximum capability. Swing angle to 120°. Shored trench. Small dump target. Working over pipe crew.
- Toughest digging (sandstone, caliche, shale, certain limestones, hard frost). Over 90% of machine’s maximum depth capability. Swing over 120°. Loading bucket in man box. Dump into small target requiring maximum excavator reach. People and obstructions in the work area.

Cat 300 Series Mass Excavation booms and buckets coupled with the proper stick will help you move material faster and more efficiently in production excavation and loading applications. With the largest bucket, shortest stick and long undercarriage your excavator can often do the work of a larger machine. A longer stick and standard undercarriage make it ideal for loading on-highway trucks and general construction jobs.

MAXIMIZING PRODUCTION WITH A MASS EXCAVATOR

Ideal Bench Height and Truck Distance — For stable or consolidated materials, bench height should be about equal to stick length. For unstable materials it should be less. The most useful truck position is when the inside truck body rail is below the boomstick hinge pin.

Optimum Work Zone and Swing Angle — For maximum production, the work zone should be limited to 15° either side of machine center or about equal to undercarriage width. Trucks should be positioned as close as possible to machine centerline. Two alternatives shown here.

Best Distance from the Edge — The machine should be positioned so that the stick is vertical when the bucket reaches full load. If the unit is farther back, breakout force is reduced. If it is closer to the edge, undercutting may occur and time is wasted bringing the stick back out. Also, the operator should begin boom-up when the bucket is 75% of the way through the curl cycle. This should be as the stick nears the vertical position.

This example reflects the ideal situation. Not all points are usable on each job, but incorporation of as many of these points as possible will positively affect production.

SELECTING A MASS EXCAVATOR

Selecting a mass excavator model for optimum production requires matching the machine and bucket to the customer’s production requirements, material, and haulers. The following 6-Step selection process will help you to consider the key factors which will impact machine selection. Failure to consider these key elements in the selection process may result in choosing a machine that is too small to efficiently handle the desired bucket size or to meet the production requirement. Selecting a mass excavator which is too large may lead to excessive loader wait time, creating excessive “load shocks” into the hauler, and/or overloading the hauler capacity.

Step 1

Determine the material type and bucket fill factor

Refer to the bucket fill factors table.

Example:

Average Blasted Rock = 75 to 90%

Step 2

Estimate the Cycle Time

Refer to the cycle time estimating chart.

Example:

$\frac{365\text{B in Hard Rock Digging}}{\text{Shot Rock}} = .43 \text{ to } .52 \text{ minute}$

Step 3

Calculate the Effective Cycles per Hour

Divide the 60 minute hour by cycle time and adjust for availability and efficiencies.

Example:

<i>Cycle Time</i>	0.48 minute
$\frac{60 \text{ minute hour}}{\text{Cycle Time}}$	$\frac{60}{0.48} = 125$
<i>Operator Skill/Efficiency</i>	0.9 (90%)
<i>Machine Availability</i>	0.95 (95%)
<i>Gen Operational Efficiency</i>	0.83 (50 min/hr)
<i>Effective Cycles per Hour</i>	$125 \times .9 \times .95 \times .83 = 89$

Step 4

Calculate the Required Bucket Capacity

Divide hourly production requirement by effective cycles per hour, adjust for material density and fill factor.

Example (Metric):

<i>Hourly Production Required</i>	500 Tons/hour
<i>Effective cycles/hour</i>	89

$$\frac{\text{Hourly Production Required}}{\text{Effective cycles/hour}} = \frac{\text{Required Payload}}{\text{Material Density/Loose}} = \frac{500}{89} = 5.6$$

<i>Material Density/Loose</i>	1.6 Ton/m ³
-------------------------------	------------------------

$$\frac{\text{Required Payload}}{\text{Material Density/Loose}} = \frac{\text{Bucket Payload}}{\text{Volume}} = \frac{5.6}{1.6} = 3.5 \text{ m}^3$$

<i>Fill Factor</i>	0.85 (85%)
--------------------	------------

$$\frac{\text{Bucket Payload}}{\text{Fill Factor}} = \frac{\text{Nominal Bucket Size}}{\text{Volume}} = \frac{3.5}{.85} = 4.1 \text{ m}^3$$

Example (English):

<i>Hourly Production Required</i>	550 tons/hour
<i>Effective cycles/hour</i>	89

$$\frac{\text{Hourly Production Required}}{\text{Effective cycles/hour}} = \frac{\text{Required Payload}}{\text{Material Density/Loose}} = \frac{550 \times 2000}{89} = 12,360 \text{ lb}$$

<i>Material Density/Loose</i>	2700 lb/yd ³
-------------------------------	-------------------------

$$\frac{\text{Required Payload}}{\text{Material Density/Loose}} = \frac{\text{Bucket Payload}}{\text{Volume}} = \frac{12,360}{2700} = 4.6 \text{ yd}^3$$

<i>Fill Factor</i>	0.85 (85%)
--------------------	------------

$$\frac{\text{Bucket Payload}}{\text{Fill Factor}} = \frac{\text{Nominal Bucket Size}}{\text{Volume}} = \frac{4.6}{.85} = 5.4 \text{ yd}^3$$

Step 5

Select Mass Excavator for required bucket size

Refer to Performance Handbook to compare machine models and bucket ranges. Confirm bucket type, size, and maximum material density in Specalog for desired model.

Example:

Required bucket capacity approximately
 4.1 m³ (5.4 yd³)

345B L Series II ME bucket capacity
 to 3.5 m³ (4.6 yd³)

365B L Series II ME bucket capacity
 to 5.3 m³ (6.9 yd³)

385B L ME bucket capacity to 5.6 m³ (7.3 yd³)

Best Choice 365B Series II with 4.0 m³ (5.2 yd³)
 Rock Bucket rated to 1.8 Ton/m³ (3000 lb/yd³)
 material density in Specalog

*Important: Re-calculate Steps 2 - 5 based on cycle times
 of model selected.*

Step 6

Select Haulers

General rule for matching trucks is based on number of cycles to fill the truck.

ME: 4 to 6 passes

Front Shovels: 3 to 5 passes

Example (Metric):

Bucket Selected 4 m³
Volume in 5 passes 5 × 4 × .85 = 17 m³
Payload 17 × 1.6 = 27.2 Tons
Consider weight of Liners 27.2 + 2 = 29.2 Tons

Suitable Truck Match Options:

735 with capacity 19.2 m³/31.8 t
 769D with capacity 24.2 m³/37.9 t

Example (English):

Bucket Selected 5.2 yd³
Volume in 5 passes 5 × 5.2 × .85 = 22.1 yd³
Payload 22.1 × 2700 = 59,670 lb
Consider weight of Liners 59,670 + 4400 lb = 64,070 lb

Suitable Truck Match Options:

735 with capacity 25.1 yd³/70,000 lb
 769D with capacity 31.7 yd³/83,570 lb

EARTHMOVING PRODUCTION

As with any other piece of material handling equipment, excavator earthmoving production is dependent on average bucket payload, average cycle time and job efficiency. If an estimator can accurately predict excavator cycle time and bucket payload, a machine’s earthmoving production can be derived from the following formula.

$$m^3 (yd^3)/60 \text{ min hr} = \text{Cycles}/60 \text{ min hr} \times \text{Avg. Bucket Payload in } m^3 (yd^3)$$

$$\frac{m^3 (yd^3)/60 \text{ min hr}}{60 \text{ min/hr}} \times \text{Avg. Bucket Payload in } m^3 (yd^3)$$

$$\text{Avg. Bucket Payload} = \text{Heaped Bucket Capacity} \times \text{Bucket Fill Factor}$$

$$\text{Actual } m^3 (yd^3)/\text{hr} = m^3 (yd^3)/60 \text{ min hr} \times \text{Job Efficiency Factor}$$

The Production Estimating Tables (next page) will provide theoretical earthmoving production in cubic meters (yards) per hour if bucket size and cycle time can be estimated. The use of an average cycle time allows adjusting the estimated production for specific job sites and applications. For instance, estimating truck loading applications should include truck exchange times which extends the average cycle time and reduces production potential. The values in the table are based on a 60 minute work hour or 100% efficiency (a condition that is never achieved in reality). The estimator should apply a job efficiency factor to the figures in the table based on his judgment or knowledge of actual job conditions.

Areas outlined on the Production Estimating Table define the work ranges of excavators in the size classes of Cat 307 through 5230 ME Excavators. The upper limit on each area corresponds to the “fastest practical” cycle time for the machines. The width of each area corresponds to the range of bucket payload sizes the machine can handle. An unshaded box has been provided in each machine area to provide a guide indicating that the upper limit of earthmoving production is being approached. When working beyond the values in the white area, the estimator should be certain that excellent job conditions will be encountered (easy digging, shallow trench, good operator, etc.).

The Production Estimating Table can also serve as a guide when selecting the proper size machine to do a job, as is shown in the following example.

Example problem (Metric)

Contractor has a job to move 15 300 Bm³ (19 100 Lm³ considering 25% swell factor) of wet sandy loam material in rear dump on-highway trucks which will be loaded by an excavator. Average face depth will be 2.4 m with 60-90 degree average swing angle. Ten days are available to do the work. Contractor plans to work 10 hrs/day and estimates a 50 min. work hour (83% job efficiency). He has two excavators that could be made available to do the work — a 320 with 1.0 m³ bucket or a 336 with 1.9 m³ bucket. Experience has shown that either machine can get its rated capacity in the sandy loam soil. Could this job be done with either machine or will the 336 have to be used?

Solution: The excavator must produce 1900 Lm³/ Day (19 100 Lm³ ÷ 10 Days) which means the required average hourly rate will be 190 Lm³/60 Min. Hr. (1900 Lm³/ Day ÷ 10 hrs/day). Further considering the 83% job efficiency, the excavator’s capability will have to be 230 Lm³/ 50 min hr.

The production estimating table shows that the 320 with a 1.0 m³ bucket would have to achieve a 17.1 sec. average cycle time to produce the required 190 Lm³/60 min. hr. With job efficiency applied a 15.0 second average cycle time is required to produce the 230 Lm³/50 min. hr. The 336 with a 1.9 m³ bucket could obtain the same 60 min. hr. production level with a 35 second average cycle, or 30 second cycles to meet the 50 min. hr. production requirement. The cycle times estimating chart shows that the 320 would be working near its maximum capability to meet the production requirement, whereas, the 336 could handle the job easily. This information can then be weighed against what else is known about the job (reach requirements, job conditions, operator ability, etc.) to decide whether or not the larger machine is needed.

Example problem (English)

Substitute these English values in the preceding problem:
Job — 20,000 BCY (25,000 LCY considering 25% swell).
Average face depth — 8-12 ft
320 L with 1.25 yd³ bucket or 336 with 2.5 yd³ bucket.

Solution: The excavator must produce 2500 LCY/ Day, which means the required average hourly rate will be 250 LCY/60 min hr. Further considering the 83% job efficiency the excavator's capability will have to be 300 LCY/50 min hr.

The same concluding comments regarding the Production Estimating Table apply here as in the Metric example.

Cubic Meters per 60 Minute Hour*

EXCAVATOR TRENCHING PRODUCTION

When an excavator is used for trenching applications, a meaningful expression of work produced is the machine's trenching rate expressed in meters or lineal feet per hour or per day. Trenching rate depends on the earthmoving production of the excavator being used and the size of the trench being excavated. Earthmoving production converts to trenching production as follows:

$$\text{Lineal Meters of Trench per Hour} = \frac{\text{Cubic Meters Excavated per Hour}}{\text{Cubic Meters per Lineal Meter of Trench}}$$

$$\text{Lineal Meters of Trench per Day} = (\text{Lineal Meters per Hour}) \times (\text{Trenching Hours per Day})$$

$$\text{Lineal Feet of Trench per Hour} = \frac{\text{Yd}^3 \text{ Excavated Per Hour}}{\text{Yd}^3 \text{ Per Lineal Foot of Trench}}$$

$$\text{Lineal Feet of Trench Per Day} = (\text{Lineal Ft Per Hour}) \times (\text{Trenching Hours Per Day})$$

For machines that work in trenching applications where they dig all of the time, the *Trenching Conversion Chart* provides easy conversion from m³ (yd³) per hour to m (lineal feet) per hour, if the excavating rate m³/hr (yd³/hr) and trench volume m³/m (yd³/ft) are known. The following examples demonstrate how the Trenching Conversion Chart can be used.

Example problem (Metric)

Contractor estimates that the 329 Excavator will produce 200 Lm³/hour. Trench survey shows that the trench contains 2.5 Lm³/meter. What trenching rate will the 329 produce?

Solution: Enter the horizontal axis of the Trenching Conversion Chart at 200 m³/Hour and move up to the 2.5 m³/m diagonal line. Then move left to the vertical axis of chart and read answer of 80 m/hour.

Example problem 2 (Metric)

Contractor knows he must produce 1000 meters of trench in every 10 hour work day. Survey shows that trench contains 1.5 Bm³ per lineal meter and soil swell factor is estimated at 30%. How much earthmoving production will the excavator have to provide in order to get the job done on time assuming a 50 min work hour? What Cat excavator will provide needed production at 6 meter maximum depth in sandy loam soil?

Solution: Determine trenching requirement 1000 meters in 10 hrs = 100 m/h. Convert Bm³ to Lm³ (excavator handles Lm³) 1.5 Bm³/m × 1.30 = 2.0 Lm³/m. Enter vertical axis of trenching conversion chart at m/h and travel horizontally to diagonal line representing 2.0 m³/m. Next move down to horizontal axis and read answer to 200 Lm³/50 min hr. Convert 200 Lm³/ 50 min hr to Lm³/ 60 min hr = 200 = 241 Lm³/60 min hr.

Production estimating tables in this section show that 241 Lm³/60 min hr is within the capability of a 329 Excavator. Job should then be checked for reach and lifting requirements to make sure that the 329 could handle these aspects of the work.

Example problem (English)

Contractor estimates that a 329 Excavator will produce 250 LCY/Hour. Trench survey shows that the trench contains 2.5 LCY/Foot. What trenching rate will the 329 produce?

Solution: Enter the horizontal axis of the Trenching Conversion Chart at 250 yd³/hr. Then move to the vertical axis of chart and read answer of 100 ft/hr.

The Trenching Conversion Chart can also be used to determine the required excavating rate if the contractor can define his trenching production requirement and the trench volume per lineal foot.

Example problem 2 (English)

Contractor knows he must produce 1000 ft of trench in every 10 hr work day. Survey shows that trench contains 1.6 BCY per lineal ft and soil swell factor is estimated at 25%. How much earthmoving production will excavator have to provide in order to get the job done on time assuming 50 min work hour? What Cat model will provide needed production at 8 ft depth in sandy loam soil?

Solution: Determine trenching requirement —
1000 ft in 10 Hrs. = 100 ft/hr
Convert BCY to LCY — 1.6 BCY/ft × 1.25 =
2.0 LCY/ft

Enter vertical axis of trenching conversion chart at 100 ft/hr and travel over to diagonal line representing 2.0 yd³/ft. Next move down to horizontal axis and read answer of 200 LCY/50 min hr.

Convert 200 LCY/50 min hr to LCY/60 min hr =
 $\frac{200}{0.83} = 241 \text{ LCY/60 min hr}$

Production estimating tables in this section show that 241 LCY/60 min. hr. is within capability of a 329 Excavator. Job should then be checked for reach and lifting requirements to make sure that the 329 could handle these aspects of the work.

TRENCHING CONVERSION CHART — CUBIC METERS (yd³) PER HOUR TO METER (ft) PER HOUR

m (ft.) = m³/(yd³) Hr.
Hr. = m³/(yd³) m (ft.)

Values in m³/m or yd³/ft

If excavating rate has been calculated in Bm³/h use Bm³/m for Trench Volume/m.
" " " " " " " " Lm³/h use Lm³/m for Trench Volume/m.
" " " " " " " " BCY/Hr use BCY/ft for Trench Volume/ft.
" " " " " " " " LCY/Hr use LCY/ft for Trench Volume/ft.

Estimating Bucket Size

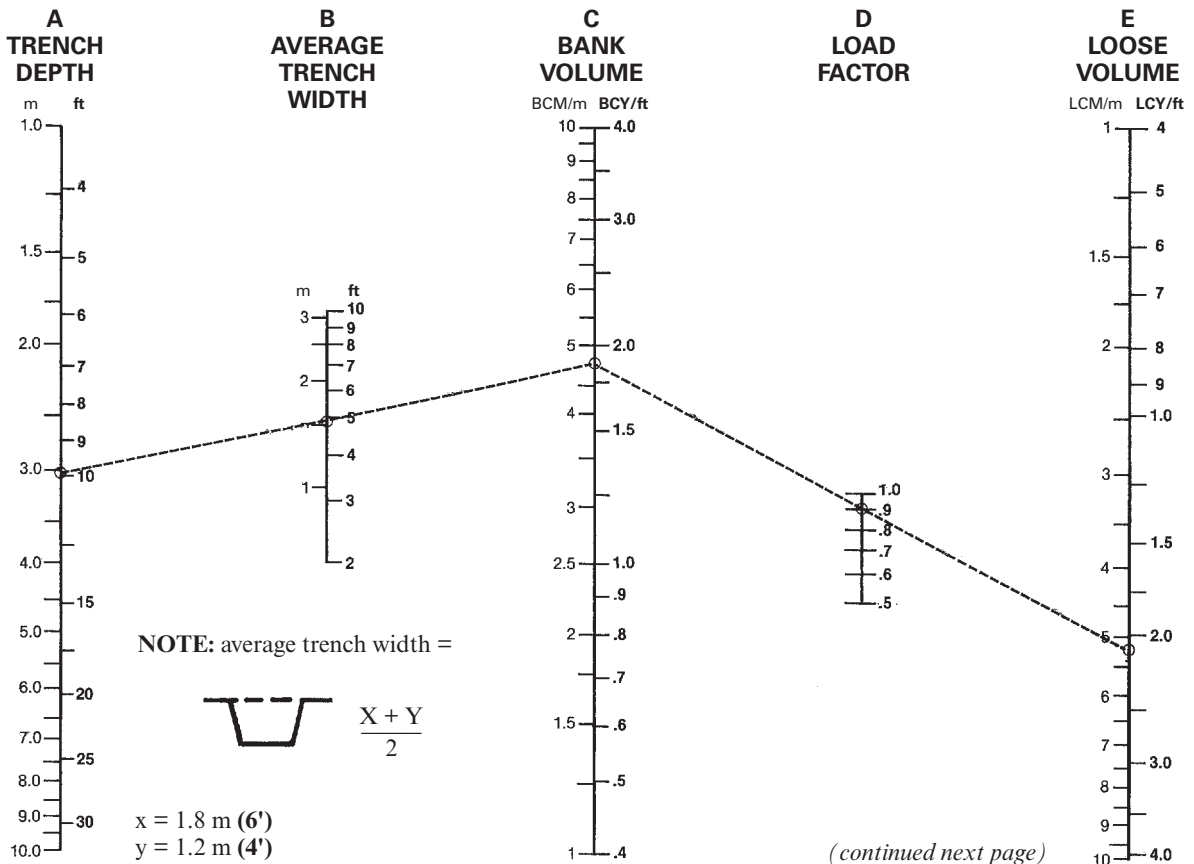

In addition to the trenching calculations on the previous pages, an alternative method of figuring trenching production is the nomograph. Shown on the following pages, this particular nomograph can be used for estimating bucket size when given trench dimensions and linear production rate. The nomograph is quicker and easier than the preceding example because it does not require as many calculations, yet the accuracy is about the same within the normal limits of input data.

Be careful when entering and reading data from the nomographs because some scales increase from bottom to top, while others are the reverse. Do not be overly concerned with the precision as affected by pencil line width or reading to the hundredth of a m³ (yd³). Remember that bucket fill factor, material density and cycle time are at best close estimates.

Example problem:

A sewer contractor owns a 329 with 2 piece boom and short stick. He wants to bid a contract for a 3.1 m (10') deep trench which measures 1.8 m (6') at the top and 1.2 m (4') at the bottom. He must dig 9 m/hr (30 ft/hr) to finish on time. The material is sand and gravel with a load factor of 0.90 and 100% bucket fill factor. He works 54 minutes per hour, half the time digging and half setting pipe. Cycle time is estimated at 23 seconds which includes a 90° swing angle.

- 1) Enter trench depth 3.1 m (10') on scale A and average trench width 1.5 m (5') on scale B.
- 2) Connect A and B and extend to scale C for bank volume per m (ft).
- 3) Enter estimated load factor (0.90) on scale D.
- 4) Connect C & D and extend to scale E for loose volume per m (ft).

(get loose volume from scale E and enter on this page scale E)

- 5) Enter required linear production rate 9 m/h (30 t/hr) on scale G.
- 6) Connect E and G. Transfer hourly production rate from scale F to scale K (next page).

- 7) Estimate cycle time (23 sec) based on anticipated conditions and enter on scale H.
- 8) Estimate hourly digging time (27 min) and enter on scale I.
- 9) Connect H through I to scale J for cycles per hour.

(get cycles per hour from scale J and enter on this page scale J)

- 10) Connect J through K to scale L for required volume per cycle.
- 11) Enter estimated bucket fill factor (100%) on scale M.
- 12) Connect L through M to scale N for required bucket size.

NOTE: Ensure bucket width does not exceed minimum trench width and also that weight of bucket and payload does not exceed machine working weight capacity (see lift capacity charts in this section).

Excavation Volumes Per Meter or Foot of Trench Length

Metric version

Bank $m^3/meter = (\text{Trench end area } m^2) \times (\text{one } m)$
 Trench volume $(Bm^3/m) = \frac{1}{2} (A + C) \times B$
 Spoil pile volume $(Lm^3/m) = (Bm^3/m) \times (1.00 + \% \text{ Swell})$

English version

Bank $yd^3/foot = \frac{(\text{Trench end area } ft^2) \times (\text{one } ft)}{27}$
 Trench volume $(BCY/ft) = \frac{\frac{1}{2} (A + C) \times B}{27}$
 Spoil pile volume $(LCY/ft) = (BCY/ft) \times (1.00 + \% \text{ Swell})$

The following table provides a general guide to trench bottom width for various outside diameters of pipe.

Pipe Diameter		Trench Width		Pipe Diameter		Trench Width

- Trenching Rate With Pipesetting
- Pipesetting Example Problem

Trenching Production with Pipesetting

On many sewer construction jobs the excavator does more than just dig the trench. Other tasks include handling the shoring system, placing bedding material, and lowering the pipe. The normal work procedure is to open a section of trench and then stop and make a pipe installation before going on to dig the next section of trench. At that point the key to trenching production is the total amount of time required to install each section of pipe. Pipe installation time can be broken down as follows:

Digging time + other time = Total pipe installation time

Total Pipe Installation Time	Pipe Installed Per Hour
60 min	1 Pipe/hr
30 min	2 Pipe/hr
15 min	4 Pipe/hr
10 min	6 Pipe/hr

Digging Time can be calculated once the trenching rate has been calculated using the methods described earlier in this section. Once Digging Time has been calculated, it can be added to an estimate of “Other Time” to determine Total Pipe Installation Time. “Other Time” can be estimated based on a contractor’s judgment, experience, or actual measurement on a job. The following formula and table relate the trenching rate of the excavator to the time required to open a section of trench for pipe of various lengths.

$$\text{Digging Time (Min.)} = \frac{\text{Pipe Length (ft)}}{\text{Trenching Rate (ft/hr)}} \times 60 \text{ (Min/hr)}$$

Trenching Rate Ft. Per Hour	Time Required to Dig for Pipe of Various Lengths							
	8 ft Pipe		12 ft Pipe		16 ft Pipe		20 ft Pipe	
	Hours	Min.	Hours	Min.	Hours	Min.	Hours	Min.
20 ft/hr	0.400	24.00	0.600	36.00	0.800	48.00	1.000	60.00
40	0.200	12.00	0.300	18.00	0.400	24.00	0.500	30.00
60	0.130	8.00	0.200	12.00	0.260	16.00	0.333	20.00
80	0.100	6.00	0.150	9.00	0.200	12.00	0.250	15.00
100	0.080	4.80	0.120	7.20	0.160	9.60	0.200	12.00
120	0.060	4.00	0.100	6.00	0.120	7.20	0.167	10.00
140	0.057	3.43	0.086	5.14	0.114	6.86	0.143	8.57
160	0.050	3.00	0.075	4.50	0.100	6.00	0.125	7.50
180	0.044	2.66	0.067	4.00	0.089	5.33	0.111	6.67
200	0.040	2.40	0.060	3.60	0.080	4.80	0.100	6.00

This table can be used to show how an excavator that is capable of more trenching production will provide significant advantages even on jobs where the machine does not dig all of the time. Consider 12,000' job with

12' sections of pipe (1000 pipe to be installed). Excavator “A” can work at 60 ft/hr while Excavator “B” is capable of producing 120 ft/hr. Table shows that Excavator “B” will only take 0.10 hr to do the same work. This means that over the course of installing the 1000 pipe the more productive machine will save 0.10 hr/pipe or 100 hours of working time.

Example problem (English)

The following example shows how trenching production can be calculated on a job where the excavator is also required to set pipe. This example is based on the assumption that the excavator’s earthmoving rate and the pipe installation time have already been estimated by the contractor.

Problem: Contractor estimates that the 350 Excavator will be able to produce 500 LCY/60 min. hr. Survey shows that an average cross section trench contains 3.2 BCY/ft and swell factor for sandy clay soil is estimated at 25%. How much trenching production can a contractor expect; assuming it takes 10.0 min. to install each 20 ft length of pipe after trench has been opened. Also assume 83% job efficiency — 50 min. work hour and 8 work hours out of a 9 hour shift. (0.5 hours for lunch and two 15 minute breaks.)

Solution:

Convert trench volume to LCY/ft:

$$1.25 (3.2 \text{ BCY/ft}) = 4.0 \text{ LCY/ft}$$

Convert Earthmoving rate to Trenching rate:

$$\frac{500 \text{ LCY/hr}}{4.0 \text{ LCY/ft}} = 125 \text{ ft/hr}$$

Calculate digging time for each pipe:

$$\frac{20 \text{ ft/pipe}}{125 \text{ ft/hr}} = 0.16 \text{ hr/pipe} = 9.6 \text{ min}$$

Calculate pipe installation time:

$$\text{Digging time} = 9.6 \text{ min}$$

$$\text{Other time} = 10.0 \text{ min}$$

$$\text{Pipe Installation time} = 19.6 \text{ min}$$

Calculate pipe installations/hour:

$$\frac{60 \text{ min/hr}}{19.6 \text{ min/pipe}} = 3.06 \text{ pipe/hr}$$

Calculate max. pipe installations/day:

$$8 \text{ hrs} (3.06 \text{ pipe/hr}) = 24.48 \text{ pipe/day}$$

Actual pipe/day:

$$0.83 (24.48 \text{ pipe/day}) = 20.3 - 20 \text{ pipe/day}$$

Actual feet/day:

$$(20 \text{ pipe/day}) \times (20 \text{ ft/pipe}) = 400 \text{ ft/day}$$

HYDRO MECHANICAL TOOLS FOR COMPACT EQUIPMENT

Please reference the Skid Steer Loaders/Multi Terrain Loaders/Compact Track Loaders section for the following hydro mechanical tools:

- Augers
- Backhoes
- Brooms
- Brushcutters
- Cold Planers
- Vibratory Compactors
- Mulchers
- Landscape Rakes
- Power Box Rakes
- Wheel Saws
- Snow Blowers
- Stump Grinders
- Landscape Tillers
- Trenchers

HYDRAULIC HAMMERS

H25D Hammer Features:

- **Streamlined Shape** fits into narrow places.
- **Simple Design** has only two moving parts for minimal maintenance.
- **High Blow Rate** translates to high productivity.
- **Lower Tool Bushing** can be replaced in minutes in the field.

H35E s-H65E s Hammer Features:

- **Available** in both side plate and silenced versions.
- **Mounting Options** include integral pin-on and flat-top.
- **Gas-fired Operating Cycle** delivers consistent, reliable performance over time.
- **Auto Shut Off (ASO)** — Instantly stops the piston when breaking through material. Prevents blank firing, which is a top cause of hammer wear.
- **Plug and Perform** — No adjustment to pressures or flows is needed.
- **Dual Ports** optimize hose runs on HEX, BHL and SSL/MTL machines.
- **One-piece Body** reduces components, eliminates tie rods and nuts.
- **Single Bushing** design is slip fit and field-replaceable.
- **Tri-suspension System** guides the power cell and gives manageable, smooth performance.
- **Grease Point** is ergonomically located at standing height.
- **Cylinder Sleeve** provides replaceable protection for the cylinder, and drastically cuts labor for rebuilds.
- **Designed to Be Easily Rebuilt**, providing lasting value for your hammer investment.

H75E s-H95E s Hammer Features:

- **Silencing** is standard on all H75E s and H95E s hammers.
- **Tri-suspension System** buffers the power cell, reducing noise and vibration.
- **Integral Accumulator** dampens pressure peaks and pulsation, thus protecting carrier hydraulic system.
- **Gas-fired Operating Cycle** delivers consistent, reliable performance over time.
- **Automatic Shut-off** protects the hammer from blank firing and reduces internal wear, protecting the hammer from less experienced operators.
- **Fully Enclosed Housing** protects the power cell, and is designed to eliminate stress points.
- **Gas Seal System** assures constant power is maintained between service intervals.
- **Single Grease Point** provides hammer paste to tool bushings. Grease point is ergonomically located at standing height making it comfortable for the operator to access.
- **Tool Changes** are simple: easily accomplished with common hand tools. Lower tool bushing can be serviced in the field.
- **Slip Fit Lower Tool Bushing** provides positive tool alignment, is field replaceable and rotatable.
- **Easy to Maintain** — Gas charges can be checked and filled with the hammer mounted on the machine.
- **Designed to Be Easily Rebuilt**, providing lasting value for your hammer investment.

H110E s-H180E s Hammer Features:

- **Unique Suspension System** — Improved recoil, support and guidance protects the carrier, increases hammer durability. Entire power cell is secured firmly inside housing. Noise suppression, operator feel and control is improved.
- **Auto Shut Off (ASO)** — Instantly stops the piston when breaking through material. Prevents blank firing, which is a top cause of hammer wear. Reducing wear improves maintenance and more productive hours of work.
- **Accumulator** — Self-contained membrane accumulator designed for long life. Port is accessible while hammer is mounted on the machine making testing and recharging a routine task achievable in the field.
- **Hydraulic Valves** — A Pressure Control Valve (PCV) maintains maximum hydraulic pressure to ensure the hammer delivers all blows at full power. PCV can be easily checked and adjusted from outside the hammer in about 30 minutes. A check valve (not shown) isolates harmful pulsation spikes from the carrier hydraulic circuit.
- **Autolube Connection and Grease Channel** — Provides grease to the upper and lower tool bushings to ensure proper greasing, longer life for bushings and tool.
- **Seal Carrier** — Contains special high performance seals to extend leak-proof operation.
- **Piston** — Long piston transfers a long shock wave into the rock. Tool-piston diameters are matched for maximum energy transfer.
- **Tie-Rods** — Larger threads improve load carrying capability, durability and reliability.
- **Cylinder** — Engineered to be durable and reliable with minimal maintenance and downtime.
- **Upper Tool Bushing** — Guides the tool to optimize in-line piston to tool contact.
- **Tool Retaining Pins and Keepers** — Tool removal process is simplified, achievable with common hand tools. Removal time reduced by 40% over previous models.
- **Lower Tool Bushing** — As bushing reaches the wear limit, it can be easily rotated (90°) or replaced to bring it back into specification. Dust seals keep contaminants out.

NOTE: Internal components of hammers are machined to close tolerances and require clean oil with full lubricating properties. When operating in high ambient temperatures or extreme temperature applications (e.g. foundries), higher viscosities are recommended to extend hammer life and improve performance. Hammers tend to shear multigrade mineral oil so that oil viscosity decreases. Contamination, water in oil, and decreased viscosity lead to earlier oil deterioration and the need for more frequent oil changes than normally recommended for the excavator. Extra care should be taken to avoid the entry of dust or dirt when installing or removing a hammer in the field.

¹ Includes power cell, side plates/housing, average mounting bracket, where required, and standard tool.

² Approximate value, actual impact frequency depends on oil flow, oil viscosity, temperature, and hardness of material to be broken.

³ Approximate value, operating pressure depends on oil flow, oil viscosity, temperature, material to be broken, and back pressure. Operating pressure is the result of correct low pressure adjustment.

Oil temperature working range for all models: -20° C to +80° C (-4° F to +176° F).

Oil viscosity at operating oil temperature: 15 to 1000 cSt.

Principles of Selection

Key to the successful sale of a hammer is proper hammer selection.

Background Information

Collection of background information is the first step. The following information will assist in being sure the customer receives the correct hammer and that he has a positive hammer experience. The following issues should be examined...

1. If any, what brand and model hammer was previously used and how did the hammer perform?
2. What % of time will the hammer be used on the machine?
3. Will the hammer be used in primary breaking or secondary breaking? (mainly an issue for large hammers)
4. What machine will the hammer be used on and what are the hydraulic flow and pressures of this machine?
5. What is the type of material to be broken and production required from the hammer? (best to obtain this from the end user but a table is available at the end of this section)

Hammer Selection Process

1. Using Cat carrier matching matrix on next page identify 2 or 3 possible hammers for your application (for competitive carriers use carrier weight class as reference).
2. Compare machine/carrier flow and pressures to those of the hammer candidates to validate compatibility. Eliminate hammers outside carrier specs.
3. If hammer is to be used in primary breaking consider larger of hammer candidates.
4. Check productivity guidance tables at the back of this section. Identify hammer most compatible with requirements.
5. Determine if the application requires special hammer modifications, i.e. steel mill, underwater, tunneling, etc.

Other Issues

Once the hammer has been chosen, other elements need to be considered to have a successful hammer experience.

1. Select the correct hammer tool for the application (see tool application chart in this section).
2. Check to be sure the correct hammer bracket and hoses are specified. Be sure correct carrier oil is specified for hammer use (particularly important in high ambient areas).
3. Consider supplemental carrier cooling in areas of high ambient temperature.

Actual operating pressure and back pressure **MUST** be checked when the hammer is fitted to the carrier (just as important if the hammer goes on a competitive carrier or is installed by the contractor at his shop).

Guarding Recommendation

Hammers used in hazardous applications like demolition, quarrying, and scaling, can create a need for special operator guarding due to flying objects. When using a hammer, additional protective devices such as a front screen, Falling Object Guarding System (FOGS, includes top and front guarding), thick polycarbonate windshields or a combination of these is recommended by Caterpillar. Contact your Cat dealer for operator guarding options on your machine.

*Installation of add-on optional counterweight to machine is required.

**Hydraulic flows and pressures must be checked to verify they match the requirements for the hammer being installed.

NOTE: Caterpillar recommends the use of a suitable shield/guard system to insure operator has adequate protection from flying debris.

NOTE: These matches are for general reference purposes for Cat machines only. When special boom and quick coupler arrangements are used, these matches may not apply.

NOTE: When matching hammers to competitive carriers, selection should be made by carrier weight. Refer to the carrier range at the top of the table in order to determine the correct match.

*Installation of add-on optional counterweight to machine is required.

**Hydraulic flows and pressures must be checked to verify they match the requirements for the hammer being installed.

NOTE: Caterpillar recommends the use of a suitable shield/guard system to insure operator has adequate protection from flying debris.

NOTE: These matches are for general reference purposes for Cat machines only. When special boom and quick coupler arrangements are used, these matches may not apply.

NOTE: When matching hammers to competitive carriers, selection should be made by carrier weight. Refer to the carrier range at the top of the table in order to determine the correct match.

Productivity Rates: 8 hour shift

Production rates listed are for general estimation purposes only and must not be used to guarantee any production figure to the customer. The actual working results may vary according to the quality and structure of the material to be broken, required degree of material size reduction, installation, condition of the carrier, conditions at the work site, haulage of the broken material, skills of the operator, etc.

MOBILE SCRAP AND DEMOLITION SHEARS

C Series Shears incorporate a bolt-on piercing tip — a key feature for enhancing up time for shears.

- Changeable with common hand tools.
- Dual-sided protecting the moving jaw on both sides.
- Fully reversible tip and blades.

Cat Mobile Scrap and Demolition Shears are available in six sizes and feature:

- Straight lower, apex upper jaw design.
- 360 degree bidirectional rotation system.
- Adjustable hub allows users to maintain tolerances between the jaws in the field.
- High force to weight ratio.
- Long wearing alloy steel blades.
- Cutting edges mounted on the side of the shear jaws and are visible to the operator.
- Shears can be mounted on boom or stick.

Applications:

Cat Mobile Scrap and Demolition Shears are designed to cut and reduce the size of metal items commonly found in scrap yards, buildings, and other structures.

The profiles on the next page approximate shear cutting capacity. The cutting capacities listed on the next page were achieved by cutting the specified steel profiles with a shear operating pressure at 35 000 kPa (5075 psi) and knives in slightly used condition. Lower operating pressures, dull knife edges, and harder steels will obviously reduce cutting capability.

Guarding Recommendation

Shears used in hazardous applications like demolition, and scrap and material handling can create a need for special operator guarding due to flying or falling objects. When using a shear, additional protective devices such as a front screen, Falling Object Guarding System (FOGS, includes top and front guarding), thick polycarbonate windshields or a combination of these is recommended by Caterpillar. Contact your Cat dealer for operator guarding options on your machine.

Cat S305 is a match for all Skid Steer Loaders 236B2 and larger and all Multi-Terrain Loaders.

Please reference bulletin GEJH0016 for matching information when utilizing a pin-grabber or dedicated coupler.

VG = Variable wide gauge undercarriage

FIX = Fixed undercarriage

MULTI-PROCESSORS

Features:

- **Wide selection** of interchangeable jaws.
- **Lifting eye placement** and adjustable stop bolts allow quick jaw changes.
- **Single, large diameter** cross mounted cylinder provides exceptional cutting and crushing force.
- **Jaws are manufactured** of high quality tool steel with outstanding tensile strength.
- **Non impact** tools that work at a relatively low noise level.

Applications:

The Cat Multi-Processors can be used to accomplish most tasks on a demolition job. One common housing with a wide selection of interchangeable jaws allows the tool to cut, crush or pulverize the toughest of materials. Highly reinforced concrete, structural steel beams, pipes, cable, steel plate and storage tanks.

Matching Guide

Stick Mounted/Reach Boom

MP318	318E, 319D, 320D/E, 320D/E RR, 321D CR, 323D/E, 324D/E M315D, M316D, M318D, M322D, M318D MH, M322 MH DEM50, DEM70, DEM100
MP324	323D, 324D/E, 328D CR, 329D/E, 336D/E DEM50, DEM70, DEM100
MP30	330D 345C 365C UHD, 385C UHD
MP40	365C, 385C

These matches are for general reference purpose for Cat machines only. Please always check the stability of the machine-tool configuration. The stability depends on application, tool used and your machine configuration. For questions please contact your Cat dealer. When choosing between various multi-processor models that can be installed onto the same machine configuration, consider work tool application, productivity requirements, and durability.

CAT MULTI-PROCESSOR INTERCHANGEABLE JAWS

Concrete Cutter Jaws (CC)

- For precise demolition/cutting of heavily reinforced concrete structures.
- Cuts structural steel and pipe.
- Equipped with replaceable concrete crusher teeth and reversible steel cutting knives.

Shear Jaws (S)

- For demolition of steel structures.
- Cuts angle and channel iron, beams, pipe, rebar, cable and tires.
- Knives are reversible.

Tank Shear Jaws (TS)

- Quickly cuts steel plate on barges, railway cars, grain, water, oil, and fuel tanks. Dual knives on the moving and static jaws produce smooth, straight edges.
- All knives are reversible.
- Available for MP20 and MP30 only.

Crusher Jaws (CR)

- For demolition of moderately reinforced concrete structures. Capable of crushing concrete and cutting rebar.
- Replaceable crusher teeth and reversible knives.

Primary Pulverizer Jaws (PP)

- Combines capability to demolish and recycle moderately reinforced concrete structures. Pulverizes concrete, cuts rebar and separates rebar from concrete. (Not available for MP40.)
- Replaceable crusher teeth and reversible knives.

Secondary Pulverizer Jaws (PS)

- Recycles demolished concrete by pulverizing concrete, separating concrete and rebar, and cutting rebar as needed.

All jaw sets can be interchanged quickly with the lifting eyes and the adjustable stopbolts on jaws and body.

Guarding Recommendation

Multi-Processors used in hazardous applications like demolition, and scrap and material handling can create a need for special operator guarding due to flying or falling objects. When using a Multi-Processor, additional protective devices such as a front screen, Falling Object Guarding System (FOGS, includes top and front guarding), thick polycarbonate windshields or a combination of these is recommended by Caterpillar. Contact your Cat dealer for operator guarding options on your machine.

Cutting Capacity

Model	MP30		MP40	
Narrow I-beams:				
Height	500 mm	19.7"	600 mm	23.6"
Flange width	200 mm	7.9"	600 mm	8.7"
Flange thickness	16 mm	0.63"	19 mm	0.75"
Web thickness	10.2 mm	0.4"	12 mm	0.47"
Wide I-beams:				
Height	310 mm	12.2"	390 mm	15.4"
Flange width	300 mm	11.8"	300 mm	11.8"
Flange thickness	15.5 mm	0.61"	19 mm	0.75"
Web thickness	9 mm	0.35"	11 mm	0.43"
Solid-round	90 mm	3.5"	100 mm	3.9"
Solid-square	80 mm	3.1"	90 mm	3.5"

The above profiles provide an indication of the shear's cutting capability. The exact cutting dimensions depend on excavator size, the conditions of the cutters and jaws and the tensile strength of the steel.

CONTRACTOR'S GRAPPLES

Features:

- Fits multiple linkages simply by changing the pin group.
- Designed with less curve allowing material to flow easily out of the grapple, simplifying material loading and unloading.
- Large wear areas made entirely of AR400 steel.
- Matches the entire range of small, medium and large excavators.
- Two-over-three tines interlock to securely grasp and retain more material when sorting and loading.
- Sized to match Cat machines making them able to better realize the machine's maximum performance; both break out and lift capacity.
- One grapple can be used with or without a coupler with no modifications.

Applications:

Contractor's Grapples are built to handle demolition of brick and wood structures, land clearing, sorting and loading of rock, scrap, pipe, waste material and demolition debris.

Guarding Recommendation

Contractor's Grapples used in hazardous applications like demolition, and scrap and material handling can create a need for special operator guarding due to flying or falling objects. When using a Contractor's Grapple, additional protective devices such as a front screen, Falling Object Guarding System (FOGS, includes top and front guarding), thick polycarbonate windshields or a combination of these is recommended by Caterpillar. Contact your Cat dealer for operator guarding options on your machine.

Features:

- **360 Degree Rotation.** Slewing ring rotation system is proven and reliable.
- **Wide Jaw Opening** handles large objects and payloads.
- **Jaw Edges** are synchronized, always closing edge to edge in the center. Pick and sort even the smallest material.
- **Grapple Body and Jaws** are made from high-grade impact-resistant steel.
- **Reinforced Jaws** handle extreme use.
- **Outer Jaw Profile** is vertical when open for working against a wall or inside containers.

- X Primary match for good stability in average scrap handling situations. Considers a material density in the 1200 kg/m³ (2000 lb/yd³) range.
- + Secondary match for **less** dense material.
- Secondary match for **more** dense material.

Guarding Recommendation

Orange Peel Grapples used in hazardous applications like scrap and material handling can create a need for special operator guarding due to flying objects. When using an Orange Peel Grapple, additional protective

devices such as a front screen, Falling Object Guarding System (FOGS, includes top and front guarding), thick polycarbonate windshields or a combination of these is recommended by Caterpillar. Contact your Cat dealer for operator guarding options on your machine.

Features:

- Suitable for a wide range of applications.
- Maximum component protection; lower operating cost.
- Low profile.
- High stability.
- Protected hydraulics.
- Connection lines protection guard.
- Tines constructed of high-strength wear resistant steel.
- Continuous, bi-directional 360° hydraulic rotator.
- Pressure limiting valve for opening and closing.
- Heavy-duty, cushioned cylinders with swing bearings on both sides.
- Maintenance covers for easy access to all maintenance points.
- Weld-on replaceable tips.
- High commonality of parts between 5 and 4 tine configurations.
- Hardened steel-alloy pins.
- High closing force.
- Excellent material penetration.
- Superior lifting capacity.

Selection by Application

Grapple Application		4 Tines				5 Tines			
		O	S	C	N	O	S	C	N
Handling Scrap, Iron and Steel	Small-sized pieces (shredded)	x				x			
	Large-sized pieces up to 1000 × 1000 mm (39" × 39") (steel scrap, wrought iron, white goods, motor blocks)								
	Heavy/long-sized pieces (I-beams, pipes, plates)			x				x	
	Car bodies			x				x	
Handling Nonferrous Scrap Metals	Small-sized pieces (beverage cans, electric devices)	x				x			
	Large-sized pieces (car radiators, batteries)								
	Wires and cables (copper, lead)								
Other Nonferrous Materials	Waste								
	Rocks, concrete blocks			x				x

Work Tools Matching Guide

Choosing the proper Orange Peel Grapple can increase productivity and lower your cost per ton.

Matching information not available. Please see marketing literature for current matching information.

Multi-Functional Concrete Crushers Europe, Africa, Middle East

Features Guarding Recommendation Matching Guide

Features:

- Multi-functional operation, the crusher combines several demolition operations in one piece of equipment. Breaking out concrete from fixed structures, pulverizing concrete and cutting reinforcement rods and small steel profiles.
- High force-to-weight ratio, the crusher's special cylinder position allows it to maintain the same power with significantly lower weight.
- Enhanced performance, the standard speed valve enables cutting/crushing with great force and in even shorter cycle times.
- Optimized serviceability, the teeth and blades are replaceable and the hydraulics is easy accessible through bolted hatches.

Guarding Recommendation

Multi-Functional Concrete Crushers used in hazardous applications like breaking out concrete from fixed structures, pulverizing concrete and cutting, can create a need for special operator guarding due to flying objects. When using a Multi-Functional Concrete Crusher, additional protective devices such as a front screen, Falling Object Guarding System (FOGS, includes top and front guarding), thick polycarbonate windshields or a combination of these is recommended by Caterpillar. Contact your Cat dealer for operator guarding options on your machine.

Crushing capacity:								
Concrete thickness**	550 mm	22"	650 mm	26"	800 mm	31"	950 mm	37"

*Weight excludes mounting bracket.

**The concrete thickness as published provides an indication of crushing ability. The exact crushing ability depends on proper excavator adjustment, on the tip and amount of rebar, and on the condition of the concrete, jaws and crushers.

Features:

- **Ideal for pulverizing from non fixed structures** — The Secondary Pulverizer is an excellent choice for all those recyclers who need to prepare concrete for fine crushing and is an excellent attachment for secondary demolition. Concrete chunks released during the demolition of concrete structures can be fine-crushed at source. In this process the concrete and the reinforcement are separated. This considerably reduces the transport volume, saving dumping and transportation expenses.
- **Innovative jaw arrangement** — The Cat Secondary Pulverizer offers wide jaws with pick-up tips, large opening, reversible cutting edges and fast closing times that bring a high return on your investment. This high force-to-weight work tool has been specially developed to reduce the largest possible amount of concrete in the shortest possible time.
- **Enhanced performance** — The ripper tooth splits concrete instantly and the large number of teeth have a large pulverizing effect. The cylinder of the pulverizer is equipped with a speed valve as standard. This device controls the speed of the cylinder and enables to cut/crush with great force in short cycle times.
- **Optimized serviceability** — Service and repairs are a necessary part of operating any work tool. So the less time and money needed for both, the better. That's why Caterpillar gives major attention to reducing both. The teeth and blades are replaceable and the hydraulics are easily accessible through bolted hatches. Parts commonality is designed into Cat products to significantly benefit owners of several work tools.
- **Long lifetime** — Cat Work Tools are designed to last long. Precision machined and forged parts, wear protection and stress relieving plates as well as fully protected hydraulic cylinder provide a long lifetime of low cost production.

Guarding Recommendation

Hydraulic Concrete Pulverizers are used in hazardous applications like breaking out concrete from fixed structures, pulverizing concrete and cutting; creating a need for special operator guarding due to flying objects. When using these tools, additional protective devices such as a front screen, Falling Object Guarding System (FOGS, includes top and front guarding), thick polycarbonate windshields or a combination of these is recommended by Caterpillar. Contact your Cat dealer for operator guarding options on your machine.

Auto-Connect is fast, fail-safe and reliable, and eliminates the oil spillages common with manual connections. Its design allows for high flows at low back pressures to ensure tools are used most effectively and to maintain optimum performance and matching. The design also ensures a perfect connection by balancing the connecting forces evenly across hoses. And the working pressure of the fluid maintains that connection even more securely.

Auto-Connect automatically connects up to five hydraulic ports (two high pressure and an optional drain) that typically need to be connected and disconnected by hand. That shortens the time for exchanging a hydraulic work tool from around half an hour to just a few seconds. Cutting out manual intervention also avoids potential spillage of hydraulic oil into the environment.

*Limited by hydraulic rather than tipping load.

Lift capacity ratings are based on ISO 10567:2007, they do not exceed 87% of hydraulic lifting capacity or 75% of tipping load. The load point is the center line of the bucket pivot mounting pin on the stick. The oscillating axle must be locked. Lifting capacities are based on the machine standing on a firm uniform supporting surface. For lifting capacity including bucket and/or quick coupler, the respective weight has to be subtracted from above values. The use of a work tool attachment point to handle/lift objects, could affect the machine lift performance.

Always refer to the appropriate Operation and Maintenance Manual for specific product information.

Lift Capacities

All values are in lb, without bucket and without QC, with counterweight (4000 kg/8818 lb), heavy lift on.

*Limited by hydraulic rather than tipping load.

Lift capacity ratings are based on ISO 10567:2007, they do not exceed 87% of hydraulic lifting capacity or 75% of tipping load. The load point is the center line of the bucket pivot mounting pin on the stick. The oscillating axle must be locked. Lifting capacities are based on the machine standing on a firm uniform supporting surface. For lifting capacity including bucket and/or quick coupler, the respective weight has to be subtracted from above values. The use of a work tool attachment point to handle/lift objects, could affect the machine lift performance.

Always refer to the appropriate Operation and Maintenance Manual for specific product information.

Lift Capacities

All values are in kg, without bucket and without QC, with counterweight (5400 kg/11,905 lb), heavy lift on.

*Limited by hydraulic rather than tipping load.

Lift capacity ratings are based on ISO 10567:2007, they do not exceed 87% of hydraulic lifting capacity or 75% of tipping load. The load point is the center line of the bucket pivot mounting pin on the stick. The oscillating axle must be locked. Lifting capacities are based on the machine standing on a firm uniform supporting surface. For lifting capacity including bucket and/or quick coupler, the respective weight has to be subtracted from above values. The use of a work tool attachment point to handle/lift objects, could affect the machine lift performance.

Always refer to the appropriate Operation and Maintenance Manual for specific product information.

Lift Capacities

All values are in lb, without bucket and without QC, with counterweight (5400 kg/11,905 lb), heavy lift on.

*Limited by hydraulic rather than tipping load.

Lift capacity ratings are based on ISO 10567:2007, they do not exceed 87% of hydraulic lifting capacity or 75% of tipping load. The load point is the center line of the bucket pivot mounting pin on the stick. The oscillating axle must be locked. Lifting capacities are based on the machine standing on a firm uniform supporting surface. For lifting capacity including bucket and/or quick coupler, the respective weight has to be subtracted from above values. The use of a work tool attachment point to handle/lift objects, could affect the machine lift performance.

Always refer to the appropriate Operation and Maintenance Manual for specific product information.

Oscillating axle needs to be locked. Weight of all lifting accessories must be subtracted from the lifting capacities. All lift capacities calculated and rated per ISO 10567:2007. Rated loads do not exceed 87% of hydraulic lift capacity or 75% of tipping load. Lifting capacities are based on the machine standing on a firm uniform supporting surface. The load point is the center line of the bucket pivot mounting pin on the stick. The use of a work tool attachment point to handle/lift objects, could affect the machine lift performance.

All lifts with heavy lift on. Always refer to the appropriate Operation and Maintenance Manual for specific product information.

M325D LMH — Lift Capacities — 5700 mm/18'8"

With 9900 mm/32'6" barge boom and 5700 mm/18'8" MH stick.

BOOM — 32'6"

STICK — 18'8"

COUNTERWEIGHT — 16,976 lb

English Units/all weights are in lbs

Radius of lift point (center line of the bucket pivot mounting pin) from Swing bearing (ft)

Oscillating axle needs to be locked. Weight of all lifting accessories must be subtracted from the lifting capacities. All lift capacities calculated and rated per ISO 10567:2007. Rated loads do not exceed 87% of hydraulic lift capacity or 75% of tipping load. Lifting capacities are based on the machine standing on a firm uniform supporting surface. The load point is the center line of the bucket pivot mounting pin on the stick. The use of a work tool attachment point to handle/lift objects, could affect the machine lift performance.

All lifts with heavy lift on. Always refer to the appropriate Operation and Maintenance Manual for specific product information.

*Indicates that the load is limited by hydraulic lifting capacity rather than tipping load.

Oscillating axle needs to be locked. Weight of all lifting accessories must be subtracted from the lifting capacities. All lift capacities calculated and rated per ISO 10567:2007. Rated loads do not exceed 87% of hydraulic lift capacity or 75% of tipping load. Lifting capacities are based on the machine standing on a firm uniform supporting surface. The load point is the center line of the bucket pivot mounting pin on the stick. The use of a work tool attachment point to handle/lift objects, could affect the machine lift performance.

All lifts with heavy lift on. Always refer to the appropriate Operation and Maintenance Manual for specific product information.

MH3022 Specifications

Model	MH3022	
Operating Weight	22 500-24 500 kg	49,604-54,013 lb
Rated Power (ISO 14396)	129 kW	173 hp
Engine Model	C7.1 ACERT™	
Emissions	U.S. EPA Tier 4 Final, EU Stage IV, Japan 2014 (Tier 4 Final)	
Maximum Travel Speed	25 km/h	15.5 mph
Fuel Tank Refill Capacity	330 L	87.2 U.S. gal
Eye Level Height (Cab Fully Raised)	4850 mm	15'11"
Tail Swing Radius	2570 mm	8'5"

* Limited by hydraulic rather than tipping load.

Lift capacity ratings are based on ISO 10567:2007, they do not exceed 87% of hydraulic lifting capacity or 75% of tipping load. The load point is the center line of the bucket pivot mounting pin on the stick. The oscillating axle must be locked. Lifting capacities are based on the machine standing on a firm uniform supporting surface. For lifting capacity including bucket and/or quick coupler, the respective weight has to be subtracted from above values. The use of a work tool attachment point to handle/lift objects, could affect the machine lift performance.

Always refer to the appropriate Operation and Maintenance Manual for specific product information.

Lift Capacities

All values are in lb, without bucket, with counterweight (9260 lb), heavy lift on.

* Limited by hydraulic rather than tipping load.

Lift capacity ratings are based on ISO 10567:2007, they do not exceed 87% of hydraulic lifting capacity or 75% of tipping load. The load point is the center line of the bucket pivot mounting pin on the stick. The oscillating axle must be locked. Lifting capacities are based on the machine standing on a firm uniform supporting surface. For lifting capacity including bucket and/or quick coupler, the respective weight has to be subtracted from above values. The use of a work tool attachment point to handle/lift objects, could affect the machine lift performance.

Always refer to the appropriate Operation and Maintenance Manual for specific product information.

Lift Capacities

All values are in kg, without bucket, with counterweight (4200 kg), heavy lift on.

*Limited by hydraulic rather than tipping load.

Lift capacity ratings are based on ISO 10567:2007, they do not exceed 87% of hydraulic lifting capacity or 75% of tipping load. The load point is the center line of the bucket pivot mounting pin on the stick. The oscillating axle must be locked. Lifting capacities are based on the machine standing on a firm uniform supporting surface. For lifting capacity including bucket and/or quick coupler, the respective weight has to be subtracted from above values. The use of a work tool attachment point to handle/lift objects, could affect the machine lift performance.

Always refer to the appropriate Operation and Maintenance Manual for specific product information.

Lifting Capacities ● MH3022 (Grenoble Sourced)

Material Handlers

Lift Capacities

All values are in kg, bucket cylinder and linkage installed, without bucket, with counterweight (4200 kg), heavy lift on.

 Load point height
  Load over front
  Load over rear
  Load over side
  Load at maximum reach (sticknose/bucket pin)

Undercarriage

MH (2.75 m) or MH Narrow (2.55 m)

Boom

6.4 m MH

Stick

4.2 m Straight Stick

*Limited by hydraulic rather than tipping load.

Lift capacity ratings are based on ISO 10567:2007, they do not exceed 87% of hydraulic lifting capacity or 75% of tipping load. The load point is the center line of the bucket pivot mounting pin on the stick. The oscillating axle must be locked. Lifting capacities are based on the machine standing on a firm uniform supporting surface. For lifting capacity including bucket and/or quick coupler, the respective weight has to be subtracted from above values. The use of a work tool attachment point to handle/lift objects, could affect the machine lift performance.

Always refer to the appropriate Operation and Maintenance Manual for specific product information.

Lift Capacities

All values are in kg, bucket cylinder and linkage installed, without bucket, with counterweight (4200 kg), heavy lift on.

Load point height Load over front Load over rear Load over side Load at maximum reach (sticknose/bucket pin)

*Limited by hydraulic rather than tipping load.

Lift capacity ratings are based on ISO 10567:2007, they do not exceed 87% of hydraulic lifting capacity or 75% of tipping load. The load point is the center line of the bucket pivot mounting pin on the stick. The oscillating axle must be locked. Lifting capacities are based on the machine standing on a firm uniform supporting surface. For lifting capacity including bucket and/or quick coupler, the respective weight has to be subtracted from above values. The use of a work tool attachment point to handle/lift objects, could affect the machine lift performance.

Always refer to the appropriate Operation and Maintenance Manual for specific product information.

Lift Capacities

All values are in kg, without bucket, with counterweight (4200 kg), heavy lift on.

*Limited by hydraulic rather than tipping load.

Lift capacity ratings are based on ISO 10567:2007, they do not exceed 87% of hydraulic lifting capacity or 75% of tipping load. The load point is the center line of the bucket pivot mounting pin on the stick. The oscillating axle must be locked. Lifting capacities are based on the machine standing on a firm uniform supporting surface. For lifting capacity including bucket and/or quick coupler, the respective weight has to be subtracted from above values. The use of a work tool attachment point to handle/lift objects, could affect the machine lift performance.

Always refer to the appropriate Operation and Maintenance Manual for specific product information.

*Limited by hydraulic rather than tipping load.

Lift capacity ratings are based on ISO 10567:2007, they do not exceed 87% of hydraulic lifting capacity or 75% of tipping load. The load point is the center line of the bucket pivot mounting pin on the stick. The oscillating axle must be locked. Lifting capacities are based on the machine standing on a firm uniform supporting surface. For lifting capacity including bucket and/or quick coupler, the respective weight has to be subtracted from above values. The use of a work tool attachment point to handle/lift objects, could affect the machine lift performance.

Always refer to the appropriate Operation and Maintenance Manual for specific product information.

Lift Capacities

All values are in kg, bucket cylinder and linkage installed, without bucket, with counterweight (4200 kg), heavy lift on.

Load point height

Load over front

Load over rear

Load over side

Load at maximum reach (sticknose/bucket pin)

Undercarriage

Boom
5.35 m MH

Stick
4.2 m Straight Stick

*Limited by hydraulic rather than tipping load.

Lift capacity ratings are based on ISO 10567:2007, they do not exceed 87% of hydraulic lifting capacity or 75% of tipping load. The load point is the center line of the bucket pivot mounting pin on the stick. The oscillating axle must be locked. Lifting capacities are based on the machine standing on a firm uniform supporting surface. For lifting capacity including bucket and/or quick coupler, the respective weight has to be subtracted from above values. The use of a work tool attachment point to handle/lift objects, could affect the machine lift performance.

Always refer to the appropriate Operation and Maintenance Manual for specific product information.

MH3024 Specifications

Model	MH3024	
Operating Weight	23 500-26 500 kg	51,809-58,422 lb
Rated Power (ISO 14396)	129 kW	173 hp
Engine Model	C7.1 ACERT	
Emissions	U.S. EPA Tier 4 Final, EU Stage IV, Japan 2014 (Tier 4 Final)	
Maximum Travel Speed	25 km/h	15.5 mph
Fuel Tank Refill Capacity	420 L	111.0 U.S. gal
Eye Level Height (Cab Fully Raised)	4850 mm	15'11"
Tail Swing Radius	2825 mm	9'3"

*Limited by hydraulic rather than tipping load.

Lift capacity ratings are based on ISO 10567:2007, they do not exceed 87% of hydraulic lifting capacity or 75% of tipping load. The load point is the center line of the bucket pivot mounting pin on the stick. The oscillating axle must be locked. Lifting capacities are based on the machine standing on a firm uniform supporting surface. For lifting capacity including bucket and/or quick coupler, the respective weight has to be subtracted from above values. The use of a work tool attachment point to handle/lift objects, could affect the machine lift performance.

Always refer to the appropriate Operation and Maintenance Manual for specific product information.

Lift Capacities

All values are in kg, bucket cylinder and linkage installed, hydraulic cab riser, work tool: none, with counterweight (5200 kg), heavy lift on.

*Limited by hydraulic rather than tipping load.

Lift capacity ratings are based on ISO 10567:2007, they do not exceed 87% of hydraulic lifting capacity or 75% of tipping load. The load point is the center line of the bucket pivot mounting pin on the stick. The oscillating axle must be locked. Lifting capacities are based on the machine standing on a firm uniform supporting surface. For lifting capacity including bucket and/or quick coupler, the respective weight has to be subtracted from above values. The use of a work tool attachment point to handle/lift objects, could affect the machine lift performance.

Always refer to the appropriate Operation and Maintenance Manual for specific product information.

Lift Capacities

All values are in kg, bucket cylinder and linkage installed, hydraulic cab riser, work tool: none, with counterweight (5200 kg), heavy lift on.

*Limited by hydraulic rather than tipping load.

Lift capacity ratings are based on ISO 10567:2007, they do not exceed 87% of hydraulic lifting capacity or 75% of tipping load. The load point is the center line of the bucket pivot mounting pin on the stick. The oscillating axle must be locked. Lifting capacities are based on the machine standing on a firm uniform supporting surface and the Variable Boom Cylinder adjusted to the maximum length. For lifting capacity including bucket and/or quick coupler, the respective weight has to be subtracted from above values. The use of a work tool attachment point to handle/lift objects, could affect the machine lift performance.

Always refer to the appropriate Operation and Maintenance Manual for specific product information.

Lifting Capacities • MH3024 (Grenoble Sourced)

Material Handlers

Lift Capacities

All values are in lb, bucket cylinder and linkage installed, hydraulic cab riser, work tool: none, with counterweight (9040 lb), heavy lift on.

*Limited by hydraulic rather than tipping load.

Lift capacity ratings are based on ISO 10567:2007, they do not exceed 87% of hydraulic lifting capacity or 75% of tipping load. The load point is the center line of the bucket pivot mounting pin on the stick. The oscillating axle must be locked. Lifting capacities are based on the machine standing on a firm uniform supporting surface and the Variable Boom Cylinder adjusted to the maximum length. For lifting capacity including bucket and/or quick coupler, the respective weight has to be subtracted from above values. The use of a work tool attachment point to handle/lift objects, could affect the machine lift performance.

Always refer to the appropriate Operation and Maintenance Manual for specific product information.

Lift Capacities

All values are in kg, bucket cylinder and linkage installed, hydraulic cab riser, work tool: none, with counterweight (5200 kg), heavy lift on.

*Limited by hydraulic rather than tipping load.

Lift capacity ratings are based on ISO 10567:2007, they do not exceed 87% of hydraulic lifting capacity or 75% of tipping load. The load point is the center line of the bucket pivot mounting pin on the stick. The oscillating axle must be locked. Lifting capacities are based on the machine standing on a firm uniform supporting surface and the Variable Boom Cylinder adjusted to the maximum length. For lifting capacity including bucket and/or quick coupler, the respective weight has to be subtracted from above values. The use of a work tool attachment point to handle/lift objects, could affect the machine lift performance.

Always refer to the appropriate Operation and Maintenance Manual for specific product information.

Lifting Capacities • MH3024 (Grenoble Sourced)

Material Handlers

Lift Capacities

All values are in lb, bucket cylinder and linkage installed, hydraulic cab riser, work tool: none, with counterweight (11,470 lb), heavy lift on.

*Limited by hydraulic rather than tipping load.

Lift capacity ratings are based on ISO 10567:2007, they do not exceed 87% of hydraulic lifting capacity or 75% of tipping load. The load point is the center line of the bucket pivot mounting pin on the stick. The oscillating axle must be locked. Lifting capacities are based on the machine standing on a firm uniform supporting surface and the Variable Boom Cylinder adjusted to the maximum length. For lifting capacity including bucket and/or quick coupler, the respective weight has to be subtracted from above values. The use of a work tool attachment point to handle/lift objects, could affect the machine lift performance.

Always refer to the appropriate Operation and Maintenance Manual for specific product information.

Lifting Capacities ● MH3024 (Grenoble Sourced)

*Limited by hydraulic rather than tipping load.

Lift capacity ratings are based on ISO 10567:2007, they do not exceed 87% of hydraulic lifting capacity or 75% of tipping load. The load point is the center line of the bucket pivot mounting pin on the stick. The oscillating axle must be locked. Lifting capacities are based on the machine standing on a firm uniform supporting surface and the Variable Boom Cylinder adjusted to the maximum length. For lifting capacity including bucket and/or quick coupler, the respective weight has to be subtracted from above values. The use of a work tool attachment point to handle/lift objects, could affect the machine lift performance.

Always refer to the appropriate Operation and Maintenance Manual for specific product information.

Lift Capacities

All values are in kg, bucket cylinder and linkage installed, hydraulic cab riser, work tool: none, with counterweight (4100 kg), heavy lift on.

*Limited by hydraulic rather than tipping load.

(continued on next page)

Lift capacity ratings are based on ISO 10567:2007, they do not exceed 87% of hydraulic lifting capacity or 75% of tipping load. The load point is the center line of the bucket pivot mounting pin on the stick. The oscillating axle must be locked. Lifting capacities are based on the machine standing on a firm uniform supporting surface. For lifting capacity including bucket and/or quick coupler, the respective weight has to be subtracted from above values. The use of a work tool attachment point to handle/lift objects, could affect the machine lift performance.

Always refer to the appropriate Operation and Maintenance Manual for specific product information.

Lift Capacities (continued)

All values are in lb, bucket cylinder and linkage installed, hydraulic cab riser, work tool: none, with counterweight (9040 lb), heavy lift on.

* Limited by hydraulic rather than tipping load.

(continued on next page)

Lift capacity ratings are based on ISO 10567:2007, they do not exceed 87% of hydraulic lifting capacity or 75% of tipping load. The load point is the center line of the bucket pivot mounting pin on the stick. The oscillating axle must be locked. Lifting capacities are based on the machine standing on a firm uniform supporting surface. For lifting capacity including bucket and/or quick coupler, the respective weight has to be subtracted from above values. The use of a work tool attachment point to handle/lift objects, could affect the machine lift performance.

Always refer to the appropriate Operation and Maintenance Manual for specific product information.

Lift Capacities (continued)

All values are in kg, bucket cylinder and linkage installed, hydraulic cab riser, work tool: none, with counterweight (5200 kg), heavy lift on.

*Limited by hydraulic rather than tipping load.

(continued on next page)

Lift capacity ratings are based on ISO 10567:2007, they do not exceed 87% of hydraulic lifting capacity or 75% of tipping load. The load point is the center line of the bucket pivot mounting pin on the stick. The oscillating axle must be locked. Lifting capacities are based on the machine standing on a firm uniform supporting surface. For lifting capacity including bucket and/or quick coupler, the respective weight has to be subtracted from above values. The use of a work tool attachment point to handle/lift objects, could affect the machine lift performance.

Always refer to the appropriate Operation and Maintenance Manual for specific product information.

Lift Capacities (continued)

All values are in lb, bucket cylinder and linkage installed, hydraulic cab riser, work tool: none, with counterweight (11,470 lb), heavy lift on.

* Limited by hydraulic rather than tipping load.

(continued on next page)

Lift capacity ratings are based on ISO 10567:2007, they do not exceed 87% of hydraulic lifting capacity or 75% of tipping load. The load point is the center line of the bucket pivot mounting pin on the stick. The oscillating axle must be locked. Lifting capacities are based on the machine standing on a firm uniform supporting surface. For lifting capacity including bucket and/or quick coupler, the respective weight has to be subtracted from above values. The use of a work tool attachment point to handle/lift objects, could affect the machine lift performance.

Always refer to the appropriate Operation and Maintenance Manual for specific product information.

Lift Capacities (continued)

All values are in kg, hydraulic cab riser, work tool: none, with counterweight (4100 kg), heavy lift on.

*Limited by hydraulic rather than tipping load.

(continued on next page)

Lift capacity ratings are based on ISO 10567:2007, they do not exceed 87% of hydraulic lifting capacity or 75% of tipping load. The load point is the center line of the bucket pivot mounting pin on the stick. The oscillating axle must be locked. Lifting capacities are based on the machine standing on a firm uniform supporting surface. For lifting capacity including bucket and/or quick coupler, the respective weight has to be subtracted from above values. The use of a work tool attachment point to handle/lift objects, could affect the machine lift performance.

Always refer to the appropriate Operation and Maintenance Manual for specific product information.

Lifting Capacities ● MH3024 (Grenoble Sourced)

Material Handlers

Lift Capacities (continued)

All values are in lb, hydraulic cab riser, work tool: none, with counterweight (9040 lb), heavy lift on.

* Limited by hydraulic rather than tipping load.

(continued on next page)

Lift capacity ratings are based on ISO 10567:2007, they do not exceed 87% of hydraulic lifting capacity or 75% of tipping load. The load point is the center line of the bucket pivot mounting pin on the stick. The oscillating axle must be locked. Lifting capacities are based on the machine standing on a firm uniform supporting surface. For lifting capacity including bucket and/or quick coupler, the respective weight has to be subtracted from above values. The use of a work tool attachment point to handle/lift objects, could affect the machine lift performance.

Always refer to the appropriate Operation and Maintenance Manual for specific product information.

Lift Capacities (continued)

All values are in kg, hydraulic cab riser, work tool: none, with counterweight (5200 kg), heavy lift on.

*Limited by hydraulic rather than tipping load.

(continued on next page)

Lift capacity ratings are based on ISO 10567:2007, they do not exceed 87% of hydraulic lifting capacity or 75% of tipping load. The load point is the center line of the bucket pivot mounting pin on the stick. The oscillating axle must be locked. Lifting capacities are based on the machine standing on a firm uniform supporting surface. For lifting capacity including bucket and/or quick coupler, the respective weight has to be subtracted from above values. The use of a work tool attachment point to handle/lift objects, could affect the machine lift performance.

Always refer to the appropriate Operation and Maintenance Manual for specific product information.

Lift Capacities (continued)

All values are in lb, hydraulic cab riser, work tool: none, with counterweight (11,470 lb), heavy lift on.

*Limited by hydraulic rather than tipping load.

Lift capacity ratings are based on ISO 10567:2007, they do not exceed 87% of hydraulic lifting capacity or 75% of tipping load. The load point is the center line of the bucket pivot mounting pin on the stick. The oscillating axle must be locked. Lifting capacities are based on the machine standing on a firm uniform supporting surface. For lifting capacity including bucket and/or quick coupler, the respective weight has to be subtracted from above values. The use of a work tool attachment point to handle/lift objects, could affect the machine lift performance.

Always refer to the appropriate Operation and Maintenance Manual for specific product information.

Material Handlers

Lifting Capacities ● MH3024 (Grenoble Sourced)

Lift Capacities

All values are in lb, hydraulic cab riser, work tool: none, with counterweight (9040 lb), heavy lift on.

*Limited by hydraulic rather than tipping load.

Lift capacity ratings are based on ISO 10567:2007, they do not exceed 87% of hydraulic lifting capacity or 75% of tipping load. The load point is the center line of the bucket pivot mounting pin on the stick. The oscillating axle must be locked. Lifting capacities are based on the machine standing on a firm uniform supporting surface. For lifting capacity including bucket and/or quick coupler, the respective weight has to be subtracted from above values. The use of a work tool attachment point to handle/lift objects, could affect the machine lift performance.

Always refer to the appropriate Operation and Maintenance Manual for specific product information.

Lift Capacities

All values are in kg, hydraulic cab riser, work tool: none, with counterweight (5200 kg), heavy lift on.

* Limited by hydraulic rather than tipping load.

(continued on next page)

Lift capacity ratings are based on ISO 10567:2007, they do not exceed 87% of hydraulic lifting capacity or 75% of tipping load. The load point is the center line of the bucket pivot mounting pin on the stick. The oscillating axle must be locked. Lifting capacities are based on the machine standing on a firm uniform supporting surface. For lifting capacity including bucket and/or quick coupler, the respective weight has to be subtracted from above values. The use of a work tool attachment point to handle/lift objects, could affect the machine lift performance.

Always refer to the appropriate Operation and Maintenance Manual for specific product information.

Lifting Capacities ● MH3024 (Grenoble Sourced)

Material Handlers

Lift Capacities (continued)

All values are in lb, hydraulic cab riser, work tool: none, with counterweight (11,470 lb), heavy lift on.

385C MH	17.2 m (56'6") Front								X

Grapple size must be matched to the machine size, linkage configuration and considering material density. For material density in the 1200 kg/m³ (2000 lb/yd³) range the grapple in the table above can be used. For different material densities, please contact your Cat dealer for other grapple options.

INSTITUTE OF SCRAP RECYCLING INDUSTRIES INC.

Scrap Specifications Guidelines for Ferrous Scrap

ISRI

Code Definition

- 200 **No. 1 heavy melting steel.** Wrought iron and/or steel scrap 6.35 mm ($\frac{1}{4}$ in) and over in thickness. Individual pieces not over 1524 × 610 mm (60 × 24 in) (charging box size) prepared in a manner to insure compact charging.
- 203 **No. 2 heavy melting steel.** Wrought iron and steel scrap, black and galvanized, 3.18 mm ($\frac{1}{8}$ in) and over in thickness, charging box size to include material not suitable as No. 1 heavy melting steel. Prepared in a manner to insure compact charging.
- 207 **No. 1 busheling.** Clean steel scrap, not exceeding 305 mm (12 in) in any dimensions, including new factory busheling (for example, sheet clippings, stampings, etc.). May not include old auto body and fender stock. Free of metal coated, limed, vitreous enameled, and electrical sheet containing over 0.5 percent silicon.
- 208 **No. 1 bundles.** New black steel sheet scrap, clippings or skeleton scrap, compressed or hand bundled, to charging box size, and weighing not less than 34 kg (75 lb) per cubic foot. (Hand bundles are tightly secured for handling with a magnet.) May include Stanley balls or mandrel wound bundles or skeleton reels, tightly secured. May include chemically detinned material. May not include old auto body or fender stock. Free of metal coated, limed, vitreous enameled, and electrical sheet containing over 0.5 percent silicon.
- 209 **No. 2 bundles.** Old black and galvanized steel sheet scrap, hydraulically compressed to charging box size and weighing not less than 34 kg (75 lb) per cubic foot. May not include tin or lead-coated material of vitreous enameled material.
- 210 **Shredded Scrap.** Homogeneous iron and steel scrap magnetically separated, originating from automobiles, unprepared No. 1 and No. 2 steel, miscellaneous baling and sheet scrap. Average density 23 kg (50 lb) per cubic foot.
- 211 **Shredded Scrap.** Homogeneous iron and steel scrap magnetically separated, originating from automobiles, unprepared No. 1 and No. 2 steel, miscellaneous baling and sheet scrap. Average density 34 kg (70 lb) per cubic foot.
- 219 **Machine shop turnings.** Clean steel or wrought iron turnings, free of iron borings, nonferrous metals in a free state, scale, or excessive oil. May not include badly rusted or corroded stock.
- 231 **Plate and structural steel, 1.5 m (5 ft) and under.** Cut structural and plate scrap, 1.5 m (5 ft) and under. Clean open hearth steel plates, structural shapes, crop ends, shearings, or broken steel tires. Dimensions not less than 6.35 mm ($\frac{1}{4}$ in) thickness, not over 1.5 m (5 ft) in length and 457 mm (18 in) in width. Phosphorous or sulphur not over 0.05 percent.
- 234 **Punchings and plate scrap.** Punchings or stampings, plate scrap, and bar crops containing not over 0.05 percent phosphorous or sulphur and not over 0.5 percent silicon, free from alloys. All materials cut 305 mm (12 in) and under, and with the exception of punchings or stampings, at least 3.18 mm ($\frac{1}{8}$ in) in thickness. Punchings or stampings under 152 mm (6 in) in diameter may be any gauge.

Features:

- **Cat® Four-Stroke Diesel Engines** — Turbocharged, after-cooled, adjustment-free fuel system (direct injection).
- **Electronically-Controlled Automatic Transmission** — Speed sensing device automatically shifts transmission between 1st and gear selected by operator.
- **Truck Production Management System (TPMS)** — Utilizes strut pressure sensors and an on-board micro-processor to determine payload weight, cycle segment times, delay times, actual clock time and date of each cycle.
- **VIMSTM** — Monitors all vital machine functions. Keeps operator informed of current machine operating conditions, helps reduce downtime and allows service personnel easy access to data for fast accurate diagnosis. VIMS includes the Truck Production Management System.
- **Mechanical Electronic Unit Injection (MEUITM)** in the 770 through 793D — Electronically maintains fuel settings, provides automatic altitude and air filter restriction compensation, and features automatic variable timing, improved diagnostics and increased fuel efficiency.
- **Common Rail Fuel System** — in the C175 engines are used on (793F, 794 AC, 795F AC, and 797F) trucks.
- **Oil Cooled Disc Brakes** — Provide retarding, service, parking, and secondary braking in a single sealed, fade-resistant, maintenance-free unit. Standard on the 770 through 775G and 777E, front brakes are caliper disc and can be switched out of the service system when not needed but activate as part of the secondary system. Standard on the 777G through 797F, front brakes are oil-cooled disc, providing excellent control in slippery conditions.
- **Automatic Retarder Control (ARC)** — Electronically controls braking on grade to maintain optimal engine RPM and oil cooling. ARC benefits include engine overspeed protection, ease of operation, faster downhill speeds, smoother ride and better control in slippery conditions.
- **Traction Control System (TCS)** — Electronically monitors and controls rear wheel slippage for greater traction and enhanced truck performance in poor underfoot conditions. If slippage exceeds a set limit, the oil-cooled disc brakes engage to slow the spinning wheel. Torque is then automatically transferred to the wheel with better traction. Available on the 770 through 797F.
- **Full Hydraulic Steering** — Functions with front suspension cylinders serving as kingpins.
- **Suspension Cylinders** — Four independent, self-contained, nitrogen/oil-pneumatic suspension cylinders absorb loading and road shocks. Wide spacing for stability.
- **Truck Bodies** — A variety of truck bodies are available to meet your application specific requirements. Those options include MSDII (mine specific design), X, HE, HP, dual slope and gateless coal bodies. The Caterpillar body program ensures the truck is configured for an optimal haulage solution.
- **Integral Roll Over Protective Structure (ROPS)** — Integral Four-Post ROPS cab standard on all models. Resiliently mounted to the main frame to reduce vibration and sound, the integral ROPS structure is designed as an extension of the truck frame. The ROPS/FOPS structure provides “five sided protection” for the operator and trainer.
- **Separate Hydraulic Systems** — Prevent cross contamination.
- **Safety** — Caterpillar continues to be proactive in developing construction and mining trucks that meet or exceed industry standards. Safety is an integral part of the machine design.

An example of enhanced safety through the development of products, processes and solutions includes Cat Integrated Object Detection System which is an integrated camera and radar technology. More information on Object Detection is available in the technology section.

NOTE: Not all features are available on all models at this time.

Sustainability:

A variety of features improve sustainability in areas of decreasing waste, extending component life and lowering emissions levels. The 777G, 785D and 797F trucks offer Oil Renewal systems. The 777G, 785D, 793F, 797F trucks offer Continuous Rear Axle Filtration, Extended Life Filters and Extended maintenance intervals which aid in decreasing the amount of waste contributed to our environment.

- **Engines with advanced technology** contribute less emissions to the environment while maintaining fuel efficiency.
- **Advanced Surface Technology (AST)** is a replacement for hard chrome coatings on some steel parts, including Suspension and hoist Cylinder Rods.
- **Other features on 793F, 797F Mining trucks** include rear axle oil savers, front wheel sight glass, two piece cover on the final drive, ecology drains and brake wear indicators all of which help to maximize component life.

NOTE: Not all features are available on all models at this time.

Non-Dumper Offerings:

For certain applications the Caterpillar OEM Solution Group offers non-dumper arrangements for the 770G, 772G, 773G, 775G, 777G and 785D.

Non-dumper arrangements include a water truck and tractor configuration. For updates on additional offerings please contact Caterpillar OEM Solutions Group.

NOTE: Listed features may be standard on some models. Optional on others. Contact your Cat dealer for specific information.

*See Weight Definitions and Relations on page 18 of this section. Note: No mandatory or optional attachments or fuel.

**Typical selection of mandatory and optional attachments.

***Data provided is for a representative body and liner package. Several dual slope, flat floor, and mine specific design (MSD) bodies and liner packages are available. All weights, capacities, and dimensions are dependent on the machine configuration (body type, attachments, tires, and optional equipment selected).

‡Reference Caterpillar's latest 10/10/20 Payload Policy for information on gross machine operating weight and target payload.

†Liner used for 797F is a 1/3 solid liner.

NOTE: Contact Mining Representative to use Caterpillar Weight Configurator for application specific weights.

TRUCK WEIGHT DEFINITIONS

Target Gross Machine Weight	<ul style="list-style-type: none"> - Loaded operating machine weight - Optimum productivity and cost per ton - Used for performance curves and calculations
Basic Machine Weight	Basic chassis weight including shipping fluids, but no attachments, options, body, or tires
Attachments	Combined weight of mandatory attachments and a minimal representation of optional attachments
Body Weight without Liners	Representative weight of body called out in Body Type
Full Liner	Weight of solid steel full liner package for selected Body Type
Standard Sideboard	Weight of appropriate sideboard for selected Body Type and Model
Operating Machine Weight	Basic machine weight plus full fuel, tires, rims, selected attachments, operator, and body
Debris	2%–8% of operating machine weight depending on application
Empty Operating Weight	Operating machine weight plus debris
Target Payload	Target gross machine weight minus empty operating weight

TRUCK WEIGHT RELATIONS*

Operating Machine Weight	Operating Machine Weight = Basic Machine Weight + Attachments + Body Weight without Liners + Full Liner + Standard Sideboard
Empty Operating Weight	Empty Operating Weight = Operating Machine Weight + Debris
Target Payload	Target Payload = Target Gross Machine Weight – Empty Operating Weight
Target Gross Machine Weight	TGMW
Basic Machine Weight	BMW
Operating Machine Weight	OMW
Empty Operating Weight	EOW
Target Payload	TP

*Reference Caterpillar's latest 10/10/20 Payload Policy.

USE OF BRAKE PERFORMANCE CURVES

The speed that can be maintained when the machine is descending a grade with retarder applied can be determined from the retarder curves in this section when gross machine weight and total effective grade are known.

Select appropriate grade distance chart that covers total downhill haul; don't break haul into individual segments.

To determine brake performance: Read from gross weight down to the percent effective grade. (Effective grade equals actual % grade *minus* 1% for each 10 kg/metric ton (20 lb/U.S. ton) of rolling resistance.) From this weight-effective grade point, read horizontally to the curve with the highest obtainable speed range, then down to maximum descent speed brakes can safely handle without exceeding cooling capacity. When braking, engine RPM should be maintained at the highest possible level without overspeeding. If cooling oil overheats, reduce ground speed to allow transmission to shift to next lower speed range.

Brake Performance Curves are made in compliance with ISO 10268 and applicable to Sea Level and 32° C (90° F) temperature. Contact Factory for Application Specific Performance.

**USE OF RIMPULL-SPEED-
GRADEABILITY CURVES**

For best results, use Caterpillar Fleet Production and Cost Analysis (FPC) to simulate cycle time, fuel burn, and production for Application Specific Performance inquiries. Contact Factory Representative or visit catminer.cat.com/stb for more information.

(See Wheel Tractor Scraper Section)

Total Effective Grade (or Total Resistance) is grade assistance *minus* rolling resistance.

10 kg/metric ton (20 lb/U.S. ton) = 1% adverse grade.

Example —

With a favorable grade of 20% and rolling resistance of 50 kg/metric ton (100 lb/U.S. ton), find Total Effective Grade.

$$\begin{aligned}
 (50 \text{ kg/metric ton}) &= 50 \div 10 = 5\% \text{ Effective Grade} \\
 &\quad \text{(from Rolling Resistance)} \\
 100 \text{ lb/ton} &= 100 \div 20 = 5\% \text{ Effective Grade} \\
 20\% \text{ (grade)} - 5\% \text{ (resistance)} &= \\
 15\% \text{ Total Effective Grade} &
 \end{aligned}$$

TYPICAL FIXED TIMES FOR HAULING UNITS

Wait time, delays and operator efficiency all impact cycle time. Minimizing truck exchange time can have a significant effect on productivity.

Fixed time for hauling units include:

1. Truck load time (various with loading tool)
2. Truck maneuver in load area (Truck exchange) (Typically 0.6-0.8 min.)
3. Maneuver and dump time at dump point (Typically 1.0-1.2 min.)

Total cycle time is the combination of:

1. The above fixed time
2. Hauling time (Loaded)
3. Return time (Empty)

Example — assume load tool spots hauler with full bucket

	988F	5130B
cycle times	.60	.45
First pass (dump time)	.10 min.	.05 min.
2 passes (full cycle)	.70	.50
3 passes "	1.30	.95
4 passes "	1.90	1.40
5 passes "	2.50	1.85
6 passes "	3.10	2.30
7 passes "	3.70	2.75
8 passes "	4.30	3.20
9 passes "	4.90	3.65
10 passes "	5.40	4.10

NOTE: Other sizes of loading tools will have different cycle times. See Wheel Loader section for **average** cycle times for truck loading.

MECHANICAL POWER TRAIN EFFICIENCIES

In selling against electric drive trucks, power train efficiency is an important consideration. To better illustrate the advantages of mechanical drive performance, grade horsepower, power train efficiency, and retarding horsepower should be compared to electric drive trucks.

Grade horsepower can be calculated by the following formula:

Metric

$$\text{grade HP} = \frac{\text{GMW (kg)} \times \text{TR} \times \text{Speed (km/h)}}{273.75}$$

English

$$= \frac{\text{GMW (lb)} \times \text{TR} \times \text{Speed (mph)}}{375}$$

where TR

(total resistance) = Rolling resistance + Grade resistance
(expressed as a decimal)

English example

700,000 lb GMW, 2% rolling resistance, +8% actual grade at 8.2 mph would require 1530 HP

$$\frac{700,000 \times (.02 + .08) \times 8.2}{375} = 1530 \text{ HP}$$

Metric example

317 520 kg GMW, 2% rolling resistance, +8% actual grade at 13.2 km/h would require 1530 HP

$$\frac{317\,520 \times (.02 + .08) \times 13.2}{273.75} = 1530 \text{ HP}$$

We then calculate power train efficiency by dividing grade horsepower by the gross horsepower produced by the engine. Most electric drive trucks run at constant maximum horsepower while under load. Mechanical drive trucks, however, lug the engine and may produce somewhat less than maximum horsepower. Engine power curves must be utilized to determine exact horsepower produced.

Example

$$\frac{1530 \text{ grade horsepower}}{1800 \text{ gross engine HP}} \times 100 = 85\% \text{ power train efficiency}$$

This exercise illustrates the effect of an efficient mechanical drive power train and should yield results in the 80-85% efficiency range. The same calculation for electric drive trucks would be lower (70-78% range) with a maximum efficiency of about 78% for the most common systems.

Likewise, retarding horsepower being consumed by the retarding system can be calculated by the following formula:

Metric

$$\text{retarding HP} = \frac{\text{GMW (kg)} \times \text{TR} \times \text{Speed (km/h)}}{273.75}$$

English

$$= \frac{\text{GMW (lb)} \times \text{TR} \times \text{Speed (mph)}}{375}$$

where TR

(total resistance) = Rolling resistance + Grade resistance
(expressed as a decimal)

English example

700,000 lb GMW, 2% rolling resistance, -8% actual grade at 14.7 mph would equate to -1646 HP

$$\frac{700,000 \times (.02 - .08) \times 14.7}{375} = 1646 \text{ HP}$$

Metric example

317 520 kg GMW, 2% rolling resistance, -8% actual grade at 23.6 km/h would equate to -1646 HP

$$\frac{317\,520 \times (.02 - .08) \times 23.6}{273.75} = 1646 \text{ HP}$$

This formula is intended for use in determining horsepower being consumed in the field based on field measurements. It is not intended to indicate how fast trucks should be operated on grade. Only job conditions, proper operating procedure, and good judgement should determine safe operating speeds during retarder use.

INDUSTRIES SERVED

The motor grader is one of the most versatile work tools in the Cat® product line. The M Series machines are used in numerous applications within a wide range of industries. The major industries using Cat motor graders, along with the typical applications within each, are summarized below.

● Heavy Construction

- Highway Construction
- Paving/Resurfacing
- Airport Construction
- Railroad Construction
- Dam and Levee Construction
- Haul Road Maintenance

● Governmental

- Road Maintenance
- Road Construction
- Ditch Building/Cleaning
- Snow Removal

● Building Construction

- Residential Construction
- Commercial Construction
- Industrial Construction
- Sewer and Water Systems

● Industrial

- Waste Disposal
- Pipeline Construction

● Mining

- Haul Road Maintenance
- Snow Removal

● Forestry

- Access Road Construction
- Forest Development
- Snow Removal
- Haul Road Maintenance

- **Geographic Versions** — Cat motor graders were specifically designed to meet the needs of different geographic regions and regulations. K/K2 Series for less regulated locations and M/M2/M3 Series are available with an assortment of standard features and optional equipment. All motor graders feature advanced electronically controlled Cat engines, power train components, hydraulics and machine structures.

FEATURES, M Series Motor Graders:

Building on the strong heritage of the H Series, the M Series delivers multiple technological breakthroughs, setting the new standard for motor graders. The H Series has been the industry standard in a variety of heavy construction, mining, road building and governmental applications. The M Series continues this tradition, incorporating revolutionary, customer-driven enhancements by:

- Improving ease of operation and operation training time
- Offering best-in-class operator station and unmatched visibility
- Delivering maximum productivity
- Improving availability and decreasing maintenance time

The M Series line includes eleven models: 120, 120 AWD, 140, 140 AWD, 160, 160 AWD, 12, 12 AWD, 14, 16, 24. The 120 through 14 meet construction, road building, and governmental applications. The All Wheel Drive models improve traction in poor underfoot conditions such as snow, mud, and sand. The 16 and 24 meet the specialized needs of large mining customers.

- **Operation Station:** The 120 through 16 models feature a revolutionary cab design that provides unmatched comfort, visibility, storage and ease of use, which can enhance operator confidence and productivity. The interior noise level is maintained between 70 and 74 dB(A) with the doors and windows closed.

Ease of Operation. The revolutionary joystick controls and exceptional visibility make operating easier without sacrificing control. The intuitive joystick control pattern allows both new and experienced operators to become productive quickly. Logical grouping of hydraulic functions in the joysticks allow any operator to easily control several functions at the same time. This allows the operator to be more productive and remain comfortable throughout the work shift.

Advanced Joystick Controls. Two electro-hydraulic joysticks reduce hand and wrist movement as much as 78% compared to conventional lever controls for greatly enhanced operator efficiency. The intuitive pattern is easy to learn and provides the precise implement control to allow both new and experienced operators to become productive quickly. Logical grouping of hydraulic functions in the joysticks allow any operator to control several functions at the same time for more productivity.

Visibility. The 120 through 16 models boast excellent visibility to the work area, made possible with angled cab doors, a tapered engine enclosure and a patented sloped rear window. Ample glass area and carefully placed components provide excellent visibility to enhance operator confidence and productivity in all motor grader applications. The cab design gives the operator an exceptional view forward to the blade, working surface and front tires. The black glare-reducing paint on the front frame and engine enclosure enhances visibility.

- **Drawbar, Circle and Moldboard:** The 120 through 16 models provide a broad range of extended blade positions particularly beneficial in mid-range bank sloping, ditch cutting and ditch cleaning. A long wheel base allows for an aggressive blade angle permitting material to roll more freely, reducing power requirements. Top-accessible drawbar wear inserts and the shimless moldboard retention system make DCM adjustments fast and simple, delivering more precise material control while lowering operating costs.

Top-Adjust Drawbar Wear Strips. The patented top-adjust wear strips dramatically reduce drawbar/circle adjustment time. By removing the access plates on top of the drawbar, shims and wear strips can easily be added or replaced. This feature reduces service downtime and lowers overall machine operating costs.

Shimless Moldboard Retention System. The unique shimless moldboard retention system reduces the potential for blade chatter. Adjusting screws keep the moldboard's wear strips aligned for precise blade control and dramatic reductions in service time.

- **Power Train:** Integrated, electronically controlled systems, deliver smooth reliable performance with reduced operating costs.

Smooth Shifting Transmission. The transmission design combines several key innovations to ensure smooth, powerful shifts throughout the gear range.

Advanced Productivity Electronics Control Strategy (APECS). APECS utilizes an electronic control strategy to read the input from sensors to shift the transmission at the optimal point. Event based shifting allows operators to experience faster, smoother and more consistent shifts. Note: M Series 3 Only.

Electronically Controlled Shifting. The full Electronic Clutch Pressure Control (ECPC) system optimizes inching modulation and smoothes shifting between all gears and directional changes. This provides outstanding control and also extends the life of the transmission by reducing stress on gears.

Load Compensation. This standard feature ensures consistent shift quality regardless of blade or machine load.

Hydraulic Brakes. The oil bathed, multi-disc service brakes are hydraulically actuated, providing smooth predictable braking and lower operating costs. With brakes located at each tandem wheel, the Cat motor graders offer the largest total brake surface area in the industry, delivering dependable stopping power and longer brake life.

- **Engine:** The Cat motor grader combines power management with ACERT™ Technology to deliver maximum power and efficiency while reducing the environmental impact.

ACERT Technology. ACERT Technology allows Cat engines to supply more power per unit of displacement without causing premature wear. This breakthrough technology reduces emissions during the combustion process by using advanced technology in the air and fuel systems, in conjunction with integrated electronics. ACERT Technology enhances overall engine performance while dramatically reducing exhaust emissions.

Power Management. Power Management utilizes Variable Horse Power (VHP) and Variable Horse Power Plus (VHP Plus) to optimize motor grader performance. VHP delivers additional power in the working gear while balancing fuel consumption, traction and horsepower. VHP Plus, delivers additional power in each forward gear 5th through 8th for increased speed on grade and performance.

Exhaust Emission Standards. The Cat ACERT Technology engines in the M Series Motor Graders meet U.S. EPA Tier 3/EU Stage IIIA equivalent/Japan 2006 (Tier 3) emission standards. The M Series 2 machines meet U.S. EPA Tier 4 Interim/EU Stage IIIB/Japan 2011 (Tier 4 Interim) equivalent emission standards. The M Series 3 machines meet U.S. EPA Tier 4 Final/EU Stage IV/Japan 2014 (Tier 4 Final) emission standards.

- **Hydraulics:** Electro-hydraulics enable advanced machine controls with precise and predictable movements.

Advanced Electro-Hydraulic System. The Cat motor grader product line incorporates a state-of-the-art electro-hydraulic system. This technology is the foundation for revolutionary changes of the machine and implement controls. Advanced joystick controls provide unmatched controllability with precise, predictable hydraulic movements and the reliability you expect from Cat products.

Load Sensing Hydraulics (PPPC). The time proven load-sensing system and the advanced Proportional Priority Pressure-Compensating (PPPC, or “triple-PC”) electro-hydraulic valves are designed to provide superior implement control and enhanced machine performance in all applications. Continuous matching of hydraulic flow and pressure to power demands creates less heat and reduces power consumption.

- **Serviceability:**

Grouped Service Points. Grouped daily service points in the left side service center help ensure proper maintenance and inspection routines.

Extended Service Intervals. Extended service intervals, such as 500-hour engine oil changes and 4000-hour hydraulic oil changes, reduce machine service time and increase availability.

Ecology Drains. Conveniently located ecology drains shorten service times and help keep the environment safe by preventing spills.

Diagnostics and Monitoring. Cat Messenger and Cat Message are offered as standard equipment to enhance diagnostic capabilities by displaying machine system errors and fault codes. Cat Electronic Technician is a two way communication tool that provides easy access to stored diagnostic data and lets technicians configure machine parameters through the Cat Data Link. Product Link™ provides a communication flow of vital machine data and location. Cat motor graders integrate Cat Messenger, Cat Electronic Technician, and S•O•SSM analysis for easy monitoring and fast troubleshooting, keeping your machine up and running. Note: Cat Messenger is standard on M Series and M Series 2 only. Cat Message is standard on M Series 3 only.

- **Safety.** Safety is an integral part of all machine and system designs. Cat motor graders provide a safe working environment for both the operator and ground personnel. ROPS and FOPS structures meeting current SAE and ISO requirements are standard on all Global machines. Back-up alarms are a standard feature.

Operator Presence System. The Operator Presence System keeps the parking brake engaged until the operator is seated for safe operation.

Secondary Steering System. The standard secondary steering system automatically engages in case of a drop in steering pressure, allowing the operator to steer the machine to a stop.

Speed Sensitive Steering. The steering software automatically provides an infinitely variable ratio between the joystick and the steer tires, resulting in less sensitive steering as the groundspeed increases.

Hydraulic Lockout. A simple switch located in the cab disables all implement functions while still providing machine steering control. This safety feature is especially useful while the machine is roading.

Circle Drive Slip Clutch. This standard feature protects the drawbar, circle and moldboard from shock loads when the end of the blade encounters immovable objects. It also reduces the possibility of abrupt directional changes in poor traction conditions, protecting the machine, operator and surroundings.

Blade Lift Accumulators. This optional feature uses accumulators to help absorb impact loads to the moldboard by allowing vertical blade travel. Blade lift accumulators reduce unnecessary wear and help to avoid unintended machine movement for increased operator safety.

Drop-Down Rear Lights. Optional drop-down lights fold out from the rear of the machine. This creates a wider, lower profile, to be better aligned with passenger cars.

Rearview Camera. Visibility is further enhanced with an optional Work Area Vision System (WAVS) LCD color monitor in the cab.

- **Automatic Differential Lock/Unlock.** The Auto Diff-Lock feature automatically unlocks the differential during a turn, re-locks when straight, for easier operation and improved power train protection.
- **Swing Out Cooling Fan.** This standard feature allows for easy access to the cooling cores reducing time required for clean out. The latched door requires no tools for opening and closing. Note: M Series 2 and M Series 3 Only.

FEATURES, K Series Motor Graders:

Overview

The K Series model line-up is targeted to meet customer requirements in less regulated countries. Built on the success of the Standard H Series, the K Series delivers multiple improvements in emissions control and operator features, while still maintaining the industry standard for reliability. The K Series model line up consists of the 120K, 120K2, 12K, 140K, 140K2, and 160K.

Engine

- **ACERT Engine Technology:** Cat ACERT engine technology utilizes numerous advanced components to efficiently produce more power and reduce emissions.
- **Emissions:** The K Series Motor Graders meet U.S. EPA Tier 2/EU Stage II equivalent emission standards. The K Series 2 machines are certified to Bharat Stage III and China Stage II emission standards.
- **Power Management Strategy:** The K Series power management strategy provides an additional 7.5 kW (10 hp) increase in third and another 7.5 kW (10 hp) in fourth gear through Variable Horsepower (VHP). This allows the operator to maintain maximum rim-pull while increasing ground speed and productivity.

Power Train

- **Electronic Clutch Pressure Control (ECPC):** This standard feature smoothes shifts and improves inching control. The system uses input from the transmission and operator controls to modulate the directional clutches and produce consistent shifting.
- **Autoshift:** This optional feature improves ease of operation and maximizes productivity by automatically shifting the transmission at optimal shifting points.

Serviceability

- **Grouped Service Points:** Grouped daily service points in the left side service center help ensure proper maintenance and inspection routines.
- **Diagnostic Capability:** The improved dash cluster keeps the operator informed of critical system conditions. Cat Electronic Technician is also offered, allowing faster diagnostic capabilities by service personnel. Product Link allows tracking of vital machine data and location, providing a convenient way to track the machine.
- **Extended Service Intervals:** Improvements in serviceability allow increased machine operation between service intervals. The machines can operate a full 500 hours between engine oil and filter changes, 4,000 hours between hydraulic oil changes, and 12,000 hours between engine coolant changes. This reduces downtime and operating expense.

APPLICATIONS, Motor Graders:

The broad line of Cat motor graders allows the customer to choose a motor grader that best fits the intended application. Below is a summary of the typical motor grader applications.

Finish Grading

This application involves preparing a roadway or site surface for future paving or other construction activity. The material being moved is usually a hard, dry base material on a solid underfoot. Finish blading is the motor grader application that requires the highest degree of accuracy. Thus, it is primarily done at low operating speeds — usually less than 5 km/h (3 mph) — in gears 1 and 2. To ensure a smooth, even finished surface, one gear is usually maintained for a given pass. Pass lengths during this application are usually less than 600 m (2000 feet) for road construction and 150 m (500 feet) for site development. Most finish blading is performed by contractors in the Heavy Construction and Building Construction industries.

Heavy Blading

This application involves cutting, moving, and mixing material, usually in the initial stages of surface preparation. A variety of material types are moved in this manner, and the blade tip position varies accordingly. Full blade loads are usually experienced during heavy blading, since moving material is the primary goal. Pass lengths within this application vary, but are usually less than 600 m (2000 feet). Unlike finish blading, the speed of the machine is dependent on the load being moved when heavy blading material. Typical operating speeds are from 0-10 km/h (0 to 6 mph). Therefore, gears 2 through 4 are frequently used in this application. Most heavy blading activity is performed by contractors in the Heavy Construction, Governmental, Industrial, and Forestry industries.

Site Preparation

This application involves any material cutting, moving, and mixing necessary to prepare a residential, commercial, or industrial site for construction. A variety of materials are encountered in this application. Blade loads vary depending on the activity being performed. Both heavy blading and finish blading are performed when preparing a site. Pass lengths are typically in the range of 30-300 m (100 to 1000 feet). Typical operating speeds for site preparation vary depending on whether heavy blading or finish blading activities are being performed. Most site preparation activities are performed by contractors in the Building Construction industry.

Road Maintenance

This application involves reshaping dirt or gravel roads to maintain a crown or superelevation, or restoring the surface itself. This generally involves secondary roads maintained by governmental bodies such as townships and counties. Materials being moved in this application vary from extremely hard dirt bases to moist gravel surfaces. The typical blade load falls between that of finish blading and heavy blading. Pass lengths are frequently longer than 600 m (2000 feet) and can extend for miles. The general speed range for this application is 5-16 km/h (3 to 10 mph), corresponding to gears 2 (heavy dirt) through 5 (soft gravel). As with finish blading, accuracy of the graded surface is the primary concern in this application. Thus, frequent shifts should be avoided whenever possible. A gear should be chosen and maintained unless there is a significant change in the material being moved. Most road maintenance activities are performed by the Governmental industry.

Haul Road Maintenance

This application of the motor grader involves reshaping haul roads at mining, construction, or forestry work sites, usually for the purpose of maintaining smooth travel surfaces for equipment. Materials being moved while maintaining haul roads vary widely. Typical blade loads are about one-third to half of full capacity. Haul roads that experience large hauling units travelling on soft material may require heavy blade loads in order to reshape the road surface. Pass lengths vary depending on the application but can extend for miles on remote forestry or large mine haul roads. The general speed range for haul road maintenance is heavily dependent on the material being moved as well as the grade of the haul road. Many mine sites are in mountainous areas, requiring haul roads with steep grades. Generally, haul-road maintenance is performed at speeds similar to those required for general road maintenance 5-16 km/h (3 to 10 mph).

A travel surface that allows for the safe and efficient movement of machinery is the ultimate goal with this motor grader application. Very precise roadway elevations and slopes are desired but less crucial than when finish blading. Most haul road maintenance activities are performed by the Mining, Heavy Construction, and Forestry industries.

Side/Bank Slope Work

This application involves preparing side slopes or bank slopes along roadways by placing the moldboard on a sloped surface. Slopes of up to a 2:1 angle can be cut using a motor grader. Often the motor grader is operated on the level surface adjacent to the slope, and the moldboard is extended outward to the sloped surface. Fine soils are generally encountered in this application of the motor grader. Blade loads are usually less than half of the full blade capacity, and pass lengths are seldom longer than 600 m (2000 feet). A smooth-graded sloped surface is the primary concern in this application so frequent shifts should be avoided. The typical speed range is 0-6 km/h (0 to 4 mph), corresponding to a gear selection of 1 to 3. The nominal speed is heavily dependent on the type of material being moved and on the slope of the surface. Most side/bank slope work is performed by the Heavy Construction and Governmental industries.

Ditch Building/Cleaning

This application involves cutting “V” and flat-bottom ditches for drainage purposes and rebuilding them when necessary. Due to excessive rain and/or poor material, ditches often need cleaning and reshaping. When building ditches, materials with a wide range of densities are encountered. Blade loads vary accordingly, from half to full-blade capacity. Pass lengths are usually less than 600 m (2000 feet). The primary objective is to move material in a manner that yields a ditch with the desired slope. Ditch building often involves cutting and moving material of high density. Therefore, typical speed ranges vary. Most ditch building work, however, is performed in gears 1 through 3, corresponding to a maximum speed of about 8 km/h (5 mph). Ditch cleaning usually involves blading moist materials underneath a sod cover. Blade loads are usually less than half of full blade capacity when cleaning ditches, and pass lengths are similar to those encountered in ditch building. Typical maximum speeds for this activity are similar to that of ditch building, but less of a blade load is experienced. Ditch building and cleaning activities are usually performed by the Heavy Construction and Governmental industries.

Ripping/Scarifying

This application involves conditioning hard, rough soils before they are bladed. Shanks on the ripper and/or scarifier are pushed into the ground, thus breaking up otherwise hard surfaces. Hard materials such as asphalt can also be loosened in order to make grading operations less damaging to the moldboard. Rippers and scarifiers can also be used to mix aggregates together. The materials being ripped/ scarified are usually hard and dry. Rippers generally penetrate 150-300 mm (6 to 12 inches) into the ground, while scarifiers typically penetrate to a depth of 25-200 mm (1 to 8 inches). Pass lengths are generally less than 600 m (2000 feet) for both activities. Since the material being ripped/scarified is generally hard, the typical maximum speed for this application is about 6 km/h (4 mph) gears 1-2. If the ripper/scarifier is used for mixing aggregates, the typical operating range becomes 6-20 km/h (4 to 12 mph) gears 3-6. Most ripping/scarifying activities are performed by the Heavy Construction and Governmental industries.

Snow Removal

Snow removal is the process of cutting and removing snow or ice from the roadway. In addition to the standard motor grader moldboard, other attachments such as a snow wing, V-plow, one-way plow, or reversible plow can be used to remove the snow. The moldboard itself is the most commonly used attachment for snow plowing. It is used in areas where snow depths are low, the terrain is relatively flat, and where excessive drifting does not occur. A snow wing is a moldboard that attaches to the machine's right side. The wing's curvature lifts the snow and "wings" it off the plowed surface. The snow wing is often used in conjunction with the standard moldboard, where the moldboard cuts the material and feeds it onto the wing. V-plows are mounted in front of the motor grader and are designed to dig into and lift packed snow. The typical speed range for snow removal is 10-30 km/h (6 to 18 mph), corresponding to a gear range of 3 to 7. Snow plowing often involves lower speeds than snow removal. The typical operating range for snow plowing is 8-19 km/h (5 to 12 mph) gears 2 to 4. The majority of Snow Removal/Plowing operations are performed by the Governmental, Mining, and Forestry industries.

TRUCK TO MOTOR GRADER MATCH

ALL WHEEL DRIVE (AWD)	120M/120M2, 12M2/M3, 140M/M2/M3, 160M/M2/M3	
Working Range:		
Forward Gears	gears 1-7	
Reverse Gears	gears 1-5	
Pump Type	Variable Displacement Axial Piston Pumps (2)	
Motor Type	Variable Displacement Axial Piston Motors (2)	
Front Wheel Gear Reduction	Double Planetary Reduction	
Maximum Pump Flow (each pump)	125 L/min	33 gpm
Front Wheel Torque	13 998 N·m	10,325 lb-ft
Control Type	Speed control with closed-loop feedback	

The optional AWD system utilizes dedicated left and right pumps for precise hydraulic control.

Hydrostatic Mode disengages the transmission and provides hydraulic power to the front wheels only-ininitely variable to 8 km/h (5 mph).

Exclusive AWD Steering Compensation adjusts outside front tire speed up to 50% faster than the inside tire.

Operating Pressure depends on engine speed, gear selection and operating conditions.

PRODUCTION

The motor grader is used in a variety of applications in a variety of industries. Therefore, there are many ways to measure its operating capacity, or production. One method expresses a motor grader's production in relation to the area covered by the moldboard.

Formula:

$$A = S \times (L_e - L_o) \times 1000 \times E \text{ (Metric)}$$

$$A = S \times (L_e - L_o) \times 5280 \times E \text{ (English)}$$

where A: Hourly operating area (m²/h or ft²/h)

S: Operating speed (km/h or mph)

L_e: Effective blade length (m or ft)

L_o: Width of overlap (m or ft)

E: Job efficiency

Operating Speeds:

Typical operating speeds by application

Finish Grading:	0-4 km/h	(0-2.5 mph)
Heavy Blading:	0-9 km/h	(0-6 mph)
Ditch Repair:	0-5 km/h	(0-3 mph)
Ripping:	0-5 km/h	(0-3 mph)
Road Maintenance:	5-16 km/h	(3-9.5 mph)
Haul Road Maintenance:	5-16 km/h	(3-9.5 mph)
Snow Plowing:	7-21 km/h	(4-13 mph)
Snow Winging:	15-28 km/h	(9-17 mph)

Effective Blade Length:

Since the moldboard is usually angled when moving material, an effective blade length must be computed to account for this angle. This is the actual width of material swept by the moldboard.

NOTE: Angles are measured as shown below. The effective length becomes shorter as the angle increases.

Moldboard Angle

Moldboard Length, m (ft)	Effective Length, m (ft) 30 degree blade angle	Effective Length, m (ft) 45 degree blade angle
3.658 (12)	3.17 (10.4)	2.59 (8.5)
4.267 (14)	3.70 (12.1)	3.02 (9.9)
4.877 (16)	4.22 (13.9)	3.45 (11.3)
7.315 (24)	6.33 (20.8)	5.17 (17.0)

For other blade lengths and carry angles:
 Effective length = COS [Radians (Blade L)] 3 Blade Length

Width of Overlap:

The width of overlap is generally 0.6 m (2.0 ft). This overlap accounts for the need to keep the tires out of the windrow on the return pass.

Job Efficiency:

Job efficiencies vary based on job conditions, operator skill, etc.

A good estimation for efficiency is approximately 0.70 to 0.85, but actual operating conditions should be used to determine the best value.

Example problem:

A Cat motor grader with a 3.66 m (12 ft) moldboard is performing road maintenance on a township road. The machine is working at an average speed of 13 km/h (8 mph) with a moldboard carry angle of 30 degrees. What is the motor grader’s production based on coverage area?

Note: Due to the long passes involved in road maintenance — fewer turnarounds — a higher job efficiency of 0.90 is chosen.

Solution:

From the table, the effective blade length is 3.17 m (10.4 ft).

Metric

$$\text{Production, A} = 13 \text{ km/h} \times (3.17 \text{ m} - 0.6 \text{ m}) \times 1000 \times 0.90 = 30\,069 \text{ m}^2/\text{hr} \text{ (3.07 hectares/hr)}$$

English

$$\text{Production, A} = 8 \text{ mph} \times (10.4 \text{ ft} - 2.0 \text{ ft}) \times 5280 \times 0.90 = 319,334 \text{ ft}^2/\text{hr} \text{ (7.33 acres/hr)}$$

To pinpoint the theoretical number of motor graders required to properly maintain your haul roads, based on your specific mining applications, please download the haul road maintenance calculator on <https://catminer.cat.com>.

Haul road maintenance impacts cycle time, tire, frame and drive train components, safety and ultimately your cost per ton. To achieve optimal truck productivity, your haul roads must be properly maintained.

- Moderate: ● Road Maintenance
 ● Pad Cleaning
 ● Rock Clearing
 ● Shoulder Sweeping

- Difficult: ● Ripping
 ● Spreading Dump Material
 ● Road Profiling/Reshaping

BLADE PULL

This specification is also known as drawbar pull. This spec can be calculated as follows:

Variables:

Rear weight of machine = Wr

Tire traction coefficient = T (Look up the table entitled “Coefficient of Traction Factors”)

$$Wr \times T = \text{Blade Pull}$$

Example problem:

Calculate the blade pull for a 140M Global Version machine operating in a quarry pit...

Metric

RW = 10 501 kg

T = 0.65

$$10\,501 \times 0.65 = 6825.65$$

English

RW = 23,151 lb

T = 0.65

$$23,151 \times 0.65 = 15,048.15$$

BLADE DOWN PRESSURE

This spec can be calculated as follows:

Variables:

Blade to front axle length = BA

Wheel base length = WB

Weight on front wheels = FW

Blade down pressure = BD

$$\frac{WB}{(WB - BA)} \times FW = BD$$

Example problem:

Calculate the blade down pressure for a 140M Global Version machine...

Metric

BA = 2565 mm FW = 4223 kg

WB = 6086 mm BD = ?

$$\frac{6086}{(6086 - 2565)} \times 4223 = 7299 \text{ kg}$$

English

BA = 101 in

FW = 9310 lb

WB = 240 in

BD = ?

$$\frac{240}{(240 - 101)} \times 9310 = 16,075 \text{ lb}$$

This specification is only a minor indicator of a motor grader’s productivity. It alone gives no measure of overall machine productivity. When considering motor grader production you need an optimum balance between the machine’s front and rear weights. If a machine has too much weight on the front axle, it might have a high blade down pressure spec. It will, however, lack the essential rear weight and traction needed to push through the load. Too much weight in the rear and it will not have the necessary weight in the front during heavy cuts to maintain proper steering control.

Cat machines are built with this optimum balance in mind. A Cat motor grader is engineered with the proper weight distribution necessary for maximum productivity.

Effective Blade Length*

		Moldboard							
		3.66 m (12')		4.27 m (14')		4.88 m (16')		7.32 m (24')	
Angle°		m	ft	m	ft	m	ft	m	ft
	0°	3.66	12.00	4.27	14.00	4.88	16.00	7.32	24.00
	5°	3.64	11.95	4.25	13.95	4.86	15.94	7.29	23.91
	10°	3.60	11.82	4.20	13.79	4.80	15.76	7.21	23.64
	15°	3.53	11.59	4.12	13.52	4.71	15.45	7.07	23.18
	20°	3.44	11.28	4.01	13.16	4.58	15.04	6.87	22.55
	25°	3.32	10.88	3.87	12.69	4.42	14.50	6.63	21.75
	30°	3.17	10.39	3.69	12.12	4.22	13.86	6.33	20.78
	35°	3.00	9.83	3.50	11.47	4.00	13.11	5.99	19.66
	40°	2.80	9.19	3.27	10.72	3.74	12.26	5.61	18.39
45°	2.59	8.49	3.02	9.90	3.45	11.31	5.17	16.97	

*Effective blade length is the amount of blade coverage the machine is capable of when the blade is at a given angle.

EXTREME SLOPE OPERATION

There are two ways of defining slope work. The slope perpendicular to the machine's direction of travel is commonly referred to as "Side Sloping." The slope parallel to the machine's direction of travel — the machine's ability to travel up or down terrain, is commonly referred to as "Gradeability."

Side Sloping capability for our Cat graders is somewhat subjective, but general agreement among professional operators is that working on a slope ratio of 2.5:1 (21.8 degrees) is the safe limit ... an experienced operator may be able to operate on a 2:1 (28 degrees) slope. Many factors influence this limit such as operator experience, machine configuration, tires and soil conditions, but a 2.5:1 is achievable. Further, a 3:1 slope is the approximate maximum side slope a grader can work on in straight frame configuration. The steeper side slopes all require the machine be articulated to safely navigate the slope.

Gradeability is approximately 22 degrees. This is established by the grader's ability to stop without skidding the tires while moving downhill. The motor grader can, however, *climb* grades steeper than 22 degrees. The traction coefficient is the critical factor in determining whether a grader can safely navigate the slope. Caterpillar recommends that you never climb a slope steeper than you can safely descend.

Maximum lubrication angle: We have measured the graders on a tilt table and pump cavitation occurs around 30 degrees (58% or 1.7:1). This is beyond the grade or slope a motor grader can operate on.

When working side hills and slopes, consideration should be given to the following important points.

- **Speed of Travel** — At higher speeds, inertia forces tend to make the grader less stable.
- **Roughness of Terrain or Surface** — Ample allowance should be made where the terrain or surface is uneven.
- **Mounted Equipment** — Mounted attachments such as front plows, snow wings, rippers and other mounted equipment cause the tractor to balance differently.
- **Nature of Surface** — New earthen fills may give way with the weight of the grader. Rocky surfaces may promote side slipping of grader.
- **Excessive Loads or Side Draft** — This may cause wheel slippage, where the downhill tires "dig in," increasing the angle of grader.
- **Tire Selection and Maintenance** — Consideration should be given to proper tire selection and air pressure. For more information, consult Caterpillar publications — Motor Grader Tire Selection Guide and Operation and Maintenance Manual.
- **Drawbar, Circle and Blade Position** — The position of the blade can affect the stability of the machine.
- **Articulation Angle** — Articulation angle can affect the stability of the machine.
- **Wheel Lean Angle** — Wheel lean angle can affect the stability of the machine.

NOTE: Safe operation on steep slopes may require special machine maintenance as well as excellent operator skill and proper equipment setup for the specific application. Consult Caterpillar publications for further operating tips — Operation & Maintenance Manual, Motor Grader Application Guide, and the Grade Comparison Chart in the Tables section of this Performance Handbook.

PREFACE

This handbook is a guide that can be used as a first step when configuring a truck. It allows the user to examine options and variables that affect performance of the driveline and frame.

Trucks are highly configurable machines. There are numerous choices for every major component (frame, engine, transmission, tires, axles, suspension, gear ratios, etc.). It's critical not to over or under spec a truck for an application. A well spec'd truck is typically a balance between variables like cost, GVWR, maximum speed, gradeability, startability, and fuel economy. There are also intangibles like driver preference, serviceability, and customer history to consider.

The equations and methodology in this handbook are provided to help select components and predict how they will work together to create a truck with the desired level of performance.

Time spent investigating the customers needs is critical for creating a well configured truck that will meet or exceed customer expectations. Normally, experts with years of experience and/or classroom training perform this type of work.

FEATURES

Cat® CT13 Engines

- **Cat CT Series Engines** meet EPA regulatory requirements.
- **6 cylinder — 4 valve per cylinder with intercooled dual turbochargers** for excellent response.
- **High pressure common rail fuel system** improves fuel efficiency and reduces soot.
- **Compact graphite iron block (13L)** reduces weight/ noise and increases strength.
- **Separate cooling and oil passages for block and head** to eliminate head gasket leaks.

Transmission

- **Cat CX31 full automatic:** 6 speed (based on Cat 730 articulated transmission).
 - Full electronic control allows Jake Brake integration and advanced body builder options.
 - Two standard power takeoff ports at 1 o'clock and 8 o'clock.
 - Optional rear power takeoff port allows easier access to install and service pumps.
 - External solenoids and filter allow for quicker maintenance and troubleshooting.
 - Torque converter locks up near the end of 2nd gear. Can be programmed to lock in 1st gear.
- **Eaton Fuller manual transmission:** 10–18 speeds. 10 speed manual standard.
- **Eaton Fuller Ultrashift Plus Vocational:** 10–18 speeds.

Cab Exterior

- **Premium, conventional, aluminum alloy cab** (riveted + glued) for extra strength.
- **Sloped Metton hood** for CT660 provides excellent visibility to the ground.
- **Large curved front window (1 or 2 piece)** for maximum visibility to the sides.
- **Cowl mounted mirrors** that are heated, powered, lit, and break away to reduce impact damage.
- **Three piece bumper and grill surround** for CT660 and CT680 reduces repair costs after an impact.
- **TPO fender flairs** protect the hood.
- **Piano style door hinges** for a super tight seal and to reduce wind noise.
- **Front mounted PTO (FEMPTO)** for CT681.
- **Integral front frame extensions** for CT681.
- **Stationary grill** for CT681.

Cab Interior

- **Premium grade sound insulation package** reduces operator fatigue.
- **Primary gauges** are clearly visible through the steering wheel for easy access.
- **Powered mirrors, windows, and door locks.**
- **Ergonomic dash board with tilted center stack** for easy access and storage.
- **Large rocker switches with tactile feedback.** Can be used with gloves on.
- **Maximized door, dash, overhead, and back panel storage.**
- **Radio (hands free cell, CD, USB, 1/8 auxiliary) + factory installed CB wiring.**
- **Oversized HVAC system** for quick maximum heating, defrosting, and cooling.

General Specifications

Model	BBC	Chassis	Engine
CT660S SBA	116"	6x4, 8x6	13L
CT660L SBA	122"	4x4, 6x6	13L
CT680 SFA	124"	6x4, 8x6	13L
CT681 SFA	114"	6x4	13L

Engine Specifications

Engine	BHP/GT (lbf-ft)
CT13	365/1250; 370/1350; 390/1450; 410/1450; 430/1550; 475/1700

NOTE: CT681 available with Front Engine PTO.
Gov. Speed RPM = 2100
Available CT681 hp ranges: 365-430 hp

Wheelbase

Variable: 138" – 394"

Transmission

Cat CX31 Power Shift Automatic, (6 Fwd, 1 Rev) Speeds
(2 PTO's Std.) Opt. Rear PTO
Eaton Manual 10, 11, 13, 18 Speeds
Eaton UltraShift PLUS Vocational 10, 13, 15, 18 Speeds

Frame (120,000 psi steel)

12.25 x 3.375 x 0.375	SM = 21	RBM = 2,520,000 lb
12.65 x 3.5 x 0.5	SM = 29	RBM = 3,458,580 lb
13.03 x 3.687 x 0.6880	SM = 40	RBM = 4,865,748 lb

NOTE: CT681 available with Integral Front Frame Extension.

Axles (Meritor/Dana Spicer)

13,200 lb – 23,000 lb Front
40,000 lb – 70,000 lb Rear

Suspension (Hendrickson, Chalmers, Neway)

Front: Multi Leaf (Shackle or Slipper type)
Front: Parabolic Taper Leaf
Rear: Walking Beam, Air, Spring

Brakes (Bendix and Meritor)

ABS and ASA Standard
Front Disc Brakes for Tractor 16K Axle and above
Opt.: Traction and Stability Control

Fuel Tanks

60, 80, 100, 120 U.S. gal
Polished/non polished aluminum
Dual tanks optional

GVWR

Variable: Based on Frame, Wheelbase, Axles, Suspension,
Brakes, Wheels, and Tires selected. Also, Federal
and State Laws.

Lift Axles (Watson and Chalin)

6x4: CT660 and CT681
Pusher Type: 8000 lb-20,000 lb
Tag Type: 13,200 and 20,000 lb

WEIGHT DISTRIBUTION

The first step in spec'ing a Truck is to understand how the load is distributed on the Front and Rear Axles. The load is defined as the Maximum expected weight of a fully loaded Truck. That includes the Driver, Fuel, Fluids, Payload, and Truck Body. Once the axle loading is known, it's possible to begin selecting the Frame, Engine, Transmission, Axles, Suspension, Tires, etc.

Start by identifying where (in relation to the axles) the load will come onto the truck. This can be a 5th wheel location, or the center of gravity of the Body and Payload (like a Dump Truck or Tanker). See above illustration.

Axle Loading can be found by adding up how major loads are distributed on each axle. Typical loads are the weight of the Truck Chassis, Body, Payload, or 5th wheel. Add up all the loads that apply for your Truck.

Axle Loading Due to Truck Chassis
(see "Chassis Types" tables in this section)

Front Axle Load (Given by Caterpillar) = _____ lb

Rear Axle Load (Given by Caterpillar) = _____ lb

Axle Loading Due to Body and Payload
(omit if using a 5th wheel)

Front Axle Load = (Body + Payload weight) × (A/WB)
= _____ lb

Rear Axle Load = (Body + Payload weight) × (B/WB)
= _____ lb

Axle Loading Due to 5th Wheel
(omit if using a Body)

Front Axle Load = 5th Wheel Load × (A/WB)
= _____ lb

Rear Axle Load = 5th Wheel Load × (B/WB)
= _____ lb

Axle Loading Due to Forward Mounted Loads
(Winches, Plows, etc.)

Front Axle Load = Attachment weight × (C + WB)/WB = _____ lb

Rear Axle Load = - Attachment weight × (C/WB) =
- _____ lb Negative

*Max Lift Force = Lift Axle (Rated Capacity) – Weight of the Lift Axle.

Example:

Max lift force for a 13,200 lb lift axle is approximately 12,000 lb. The remaining 1200 lb is the weight of the axle, tires, wheels, and brakes.

Axle Loading Due to Lift Axles*
(see above illustration)

Front Axle Load = - Lift Axle Force × (E/WB) =
- _____ lb Negative

Rear Axle Load = - Lift Axle Force × (D/WB) =
- _____ lb Negative

*If more than one (1) lift axle repeat as required.

Total Axle Loading

Front Axle Load = Add all Front loads that apply =
_____ lb

Rear Axle Load = Add all Rear loads that apply =
_____ lb

GVWR AND GCWR

GVWR = Gross Vehicle Weight Rating. This rating is used for a Straight Truck.

GCWR = Gross Combination Weight Rating. This rating is used for Tractors with 5th wheels.

Procedure to Determine GVWR or GCWR

- 1) Determine the maximum expected load on each axle (see Weight Distribution section).
- 2) Select Axles, Suspensions, Brakes, Wheels and Tires that are sized to take the load predicted by the Weight Distribution Study. All components must be rated equal to or greater than the expected axle loading. See Appendix D, E, F, H, I, J, K, and L for component ratings.
- 3) The lowest rated component for each axle (including the axle), is the Maximum **Axle Rating** for that axle.

GVWR = Front + Rear + Lift (Axle Rating for each axle)

GCWR = Front + Rear + Lift + Trailer (Axle Rating for each axle)

Example: Front Axle Rating

Expected Front Axle Load	12,420 lb
Axle rated for	13,200 lb
Suspension rated for	14,000 lb
Wheels rated for	14,000 lb
Tires rated for	13,800 lb
Brakes rated for	14,000 lb

In this example the front axle is the lowest rated component that will carry the load predicted by the Weight Distribution Study. Thus, the Front **Axle Rating** is 13,200 lb in this example.

Bridge Laws

Careful attention must be given to laws governing overall weight, maximum axle loading, and axle spacing. These laws are commonly referred to as Bridge Laws, and are different in every State, Region, or Province. This handbook does not cover these laws. The reader is advised to refer to their local Bridge Law formulas.

FRAME SELECTION GUIDE FOR CT660

Based on Front Axle Load, Desired GVWR and Wheelbase: Select a Frame from table below. Frame length varies in roughly two inch increments to accommodate many different body sizes. Frames can also be Reinforced (or Doubled) to carry heavier loads.

	Dimensions	Code	Front Axles	GVWR	Maximum Wheelbase															
					200	210	220	230	240	250	260	270	280	290	300	310	320	330	340	350
Not Reinforced	12.25 x 3.375 x 0.375	01CDH	12K	<=52K	331" (8400 mm)															
			13.2K	<=53.2K	329" (8350 mm)															
			14-14.6K	<=60.6K	280" (7100 mm)															
			16K	<=62K	260" (6600 mm)															
			18K	<=64K	246" (6250 mm)															
			20K	<=85K					234" (5950 mm)											
			21-22K	<=87K					222" (5650 mm)											
			23K	<=88K	215" (5450 mm)															
Reinforced	12.0 x 3.25 x 0.25 with 0.25 Outer Reinforcement	01DAV	12K	<=52K												360" (9150 mm)				
			13.2K	<=53.2K												360" (9150 mm)				
			14-14.6K	<=60.6K												358" (9100 mm)				
		01GDL	16K	<=62K	325" (8250 mm)															
			18K	<=64K	299" (7600 mm)															
			20K	<=98K	293" (7450 mm)															
			21-22K	<=100K	276" (7000 mm)															
	23K	<=101K	266" (6750 mm)																	
Reinforced	12.25 x 3.375 x 0.375 with 0.313 Outer Reinforcement	01CDH	12K	<=52K												360" (9150 mm)				
			13.2K	<=53.2K												360" (9150 mm)				
			14-14.6K	<=60.6K												360" (9150 mm)				
		01GDM	16K	<=62K												360" (9150 mm)				
			18K	<=64K	352" (8950 mm)															
			20K	<=98K	317" (8050 mm)															
			21-22K	<=100K	309" (7850 mm)															
	23K	<=101K	301" (7650 mm)																	

**FRAME SELECTION GUIDE
FOR CT680 AND CT681**

Based on Front Axle Load, Desired GVWR and Wheelbase: Select a Frame from table below. Frame length varies in roughly two inch increments to accommodate many different body sizes. Frames can also be Reinforced (or Doubled) to carry heavier loads.

Dimensions	Code	Front Axles	GVWR	Maximum Wheelbase																
				200	210	220	230	240	250	260	270	280	290	300	310	320	330	340	350	360
12.25 x 3.375 x 0.375	01CDH	12K	<=52K	299" (7600 mm)																
		13.2K	<=53.2K	274" (6950 mm)																
		14K	<=60K	258" (6550 mm)																
		16K	<=62K	258" (6550 mm)																
		18K	<=64K	254" (6450 mm)																
		20K	<=66K	254" (6450 mm)																
		20K	<=85K	205" (5200 mm)																
12.0 x 3.25 x 0.25 with 0.25 Outer Reinforcement	01DAV 01GDL	12K	<=52K	360" (9150 mm)																
		13.2K	<=53.2K	337" (8550 mm)																
		14K	<=60K	329" (8350 mm)																
		16K	<=62K	299" (7600 mm)																
		18K	<=64K	283" (7200 mm)																
		20K	<=66K	283" (7200 mm)																
		20K	<=85K	270" (6850 mm)																
12.25 x 3.375 x 0.375 with 0.312 Outer Reinforcement	01CDH 01GDM	12K	<=52K	360" (9150 mm)																
		13.2K	<=53.2K	360" (9150 mm)																
		14K	<=60K	360" (9150 mm)																
		16K	<=62K	348" (8850 mm)																
		18K	<=64K	339" (8600 mm)																
		20K	<=66K	319" (8100 mm)																
		20K	<=85K	295" (7500 mm)																

01CDH

Standard Frame Not Reinforced

SM = 21 in³

RBM = 2,520,000 lb

01DAV & 01GDL

Optional Reinforced Frame

SM = 28.82 in³

RBM = 3,458,580 lb

01CDH & 01GDM

Optional Reinforced Frame

SM = 40.45 in³

RBM = 4,865,748 lb

SM = Section Modulus is based on the cross sectional area of the frame and its distance from the neutral axis of bending.

RBM = Resistance to Bending Moment = SM × Steel Strength = SM × 120,000 psi for All Cat Frames.

SELECTING GEAR RATIOS FOR TRANSMISSION AND AXLES

Select the Desired Axle Ratio (AR)

$$AR = \frac{RPM \text{ (at cruise)} \times 60}{TR \times MPH \times M \times ATR \times DBR}$$

NOTE: This equation provides the Theoretical axle ratio. Select the closest axle ratio found in Appendix E.

RPM = Engine RPM at desired cruise. See table below or Torque Curves in Appendix C.

TR = Transmission ratio (Top gear). See Appendix D.

MPH = Desired cruise speed (not maximum speed).

M = Tire revolutions per mile. See Appendix I.

ATR = Auxiliary Transmission ratio. See Appendix D.

DBR = Drop Box Ratio. See Appendix D (omit if 1:1).

60 = Constant.

Suggested Cruise Speeds

Engine Family	Application	Engine Speed for Fuel Economy	Engine Speed for Performance	Vehicle Cruise Speed
CT13	Vocational	1375-1500	1500-1650	55
CT13	Extended Highway	1325-1375	1375-1450	65

Select the Desired Transmission Ratio (TR) Top Gear/Overdrive

$$TR = \frac{RPM \text{ (at cruise)} \times 60}{AR \times MPH \times M \times ATR \times DBR}$$

NOTE: For AR, use the Axle ratio selected from Appendix E.

NOTE: This equation provides the Theoretical Transmission ratio. Select the closest actual gear ratio from Appendix D.

Verify Cruise and Maximum Speed

Use the actual Transmission and Axle ratios you selected from Appendix D and E to verify the desired cruise and Maximum speed. Do not use the theoretical values. If you're within 5 mph of your desired cruise speed that is a good gearing combination. Otherwise, modify your choices for the Axle or Transmission Ratios to get closer. It may take a few attempts to meet your requirements.

$$MPH \text{ (cruise)} = \frac{RPM \text{ (at cruise)} \times 60}{AR \times TR \times M \times ATR \times DBR}$$

$$MPH \text{ (Max)} = \frac{2100 \text{ (max RPM)} \times 60}{AR \times TR \times M \times ATR \times DBR}$$

NOTE: Use the actual AR and TR selected from Appendix D and E for MPH (cruise) and MPH (Max).

ENGINE SELECTION

There are many factors that dictate the correct engine size for a specific application. It’s possible to use a mathematical approach to add up all the horsepower demands to size the engine. However, it’s also important to understand the application and driver habits. In addition, understand how the customer’s other trucks are configured. This critical customer knowledge is used to verify or modify the results of the mathematical approach to achieve the best engine selection for the application.

Mathematical Approach Overview: 3 step process.

- 1) Add up all the HP loads at vehicle cruise speed. Examples of HP demands are: Rolling Resistance, Drag, Slopes, Road Surface, Driveline Losses, Accessories, and Power Takeoffs.
- 2) Determine the Torque required to start fully loaded on the customer’s maximum grade. This is called (Startability).
- 3) Use your knowledge of the application to verify if the Engine selected in steps 1 and 2 makes sense.

Step 1 Calculations: Add up the HP required at the expected vehicle cruise speed.

NOTE: All the following formulas can be programmed into a Spread Sheet for faster evaluation.

Rolling Resistance: The HP required on a flat surface to overcome Tire Squat. Since tires are not perfectly round, (especially when loaded) the Truck is climbing a small slope just to move forward.

$$Pr = \frac{(6.1 + (0.06 \times MPH)) \times Cp \times GW \times MPH}{375,000}$$

Cp = Tire Pavement Factors. See table below.

GW = Gross Vehicle Weight or Gross Combination Weight required for the application.

6.1 = Constant.

0.06 = Constant.

375,000 = Constant.

MPH = Desired Cruise Speed (not maximum speed).

Tire Pavement Factors

Surface	Bias	Radial	LP Radial	Wide Base
Concrete	1.00	0.70	0.63	0.50
Cold Blacktop	1.20	0.85	0.70	0.60
Hot Blacktop	1.50	0.90	0.83	0.70
Hard Soil	1.75	1.00	0.98	0.85
Hard Gravel	2.00	1.20	1.13	1.00
Loose Gravel	7.50	1.70	1.63	1.50
Sand	12.00			

Air Resistance: The HP required to overcome wind resistance. This starts becoming significant above 30 MPH. Over 65 MPH it can be the largest single load.

$$P_a = \frac{FA \times Cd \times MPH^3}{156,000}$$

Cd = Aerodynamic Drag Coefficient. See table below.

FA = Frontal Area of the Truck (sq ft) + Area of the body or trailer that is wider or taller than the Truck. If the trailer is more than eight feet behind the Truck, FA = the Frontal Area of the Truck + the Total Frontal area of the Trailer. See illustration below.

156,000 = Constant.

MPH = Desired Cruise Speed (not maximum speed).

Aerodynamic Drag Coefficients

Configuration	Factor
HD Tractor – Full Aero/Van Trailer Full Aero	0.42
HD Tractor – Full Aero/Van Trailer Typical	0.48
MD Van Truck – Full Aero	0.50
HD Tractor – Full Aero/Van Trailer some Aero	0.54
HD Tractor – Full Aero/Tank Trailer Insulated	0.55
HD Tractor – Full Aero/Flat Trailer some Aero (Smooth Load)	0.55
HD Tractor – Full Aero/Van Trailer no Aero	0.80
HD Tractor – Full Aero/Flat Trailer some Aero (Rough Load)	0.80
HD Tractor – Full Aero/Tank Trailer Non Insulated	0.80
HD Tractor – No Aero/Van Trailer no Aero	0.80
MD Van Truck – No Aero	0.80
HD Dump	0.90
MD Dump – No Aero	0.90
HD Tractor – Car Hauler	1.00
HD Tractor – No Aero/Flat Trailer some Aero	1.00

Aero refers to side panels and deflectors to make the Truck more aerodynamic.

CT660

Gradeability: The reserve HP required to operate indefinitely (without downshifting) at the desired cruise speed on a small grade between 0.5% – 1% Grade.

$$P_g = \frac{G \times GW \times MPH}{37,500}$$

G = Grade Percent (Typically 0.5 or 1).

GW = Desired Gross Vehicle Weight or Gross Combination Weight.

37,500 = Constant.

MPH = Desired Cruise Speed (not maximum speed).

Accessories: The HP required to power the Cooling Fan, Alternator, Power Steering, A/C and Air Compressor at the desired cruise speed.

$$P_{acc} = 57 \text{ HP @ 1600 RPM} = 73 \text{ HP at 1800 RPM}$$

Considering 2100 is Max Engine RPM. Select a Pacc that best matches your application.

PTO: The HP required to power Mixers, Pumps, Generators, etc. that are running while the truck is cruising.

$$P_{pto} = \text{Supplied by Body Builder}$$

Zero if not running while cruising

Total HP Required at the Drive Wheel

$$P_{req} = P_r + P_a + P_g + P_{acc} + P_{pto}$$

Engine Selection: Account for Driveline losses and select an Engine with at least as much HP as P(eng) from table below. Continue to Step 2, to verify the Engine you selected has the required Torque.

$$P_{eng} = \frac{P_{req}}{0.93}$$

0.93 = Driveline Efficiency

Engine Specifications

Engine	Horsepower (BHP @ 1700 RPM)	Torque Peak (lbf-ft @ 1000 RPM)	Gov. Speed (RPM)	Fully Developed Torque (lbf-ft at 800 RPM)
CT13	365	1250	2100	686
CT13	370	1350	2100	770
CT13	390	1450	2100	811
CT13	410	1450	2100	828
CT13	430	1550	2100	868
CT13	475	1700	2100	959

Step 2A: (Manual and Automated Manual Transmissions) Verify the Engine selected in Step 1 can get the Truck moving on the customer’s maximum grade.

Startability: Is the ability of the truck to start moving on the steepest grade the driver will face. The equation below (S) calculates the **Theoretical** Maximum Percent grade for the Engine you selected in Step 1. To more accurately predict Startability, ground conditions must be considered. Subtract the effects of ground conditions from (S) to determine the Maximum Predicted Startability.

$$S = \frac{(Tc \times R \times M)}{(10.7 \times GW)}$$

Tc = Fully Developed Torque (from Engine selected in Step 1). See Engine Specification table.

R = The overall Driveline gear ratio.

$\frac{\text{Transmission (low gear)} \times \text{Axle} \times \text{Aux Trans} \times \text{Drop box}}{\text{Omit Aux Trans and Drop Box ratios if not used}}$

M = Tire Revolutions per mile. See Appendix I.

GW = Desired Gross Vehicle Weight or Gross Combination Weight.

10.7 = Constant.

Ground Conditions: See Tire Pavement Factors table or Subtract 6% for every inch of tire penetration.

Maximum Predicted Startability

= S – Ground Conditions

Startability must be equal to or greater than the customer’s maximum percent grade. If below Maximum, Select an Engine of equal or greater HP with Higher Fully Developed Torque from Engine Specifications table. Rerun the Startability calculations to verify. Continue to Step 3 for final Engine selection.

Step 2B: (CX31 Automatic Transmission) Verify the Engine selected in Step 1 can get the Truck moving on the customer’s maximum grade.

Startability: Is the ability of the truck to Start moving on the steepest grade the driver will face. For an Automatic Transmission a simple equation cannot be used to predict Startability. For the CX31, see the Startability chart in Appendix G. It assumes starting on the best concrete. To more accurately predict Startability, ground conditions must be considered. Subtract the effects of ground conditions from (S) to determine the Maximum Predicted Startability.

S = See Appendix G

Ground Conditions: See Tire Pavement Factors table or Subtract 6% for every inch of tire penetration.

Maximum Predicted Startability

= S – Ground Conditions

Startability must be equal to or greater than the customer’s maximum percent grade. If below Maximum, Select an Engine with equal or greater HP and Higher Fully Developed Torque from Engine Specifications table. Rerun the Startability calculations to verify.

Step 3: Final Engine Selection. In Steps 1 and 2 you selected an Engine that had enough HP to maintain cruise speed and start on the maximum grade. Before making the final Engine selection, factor in application and driver habits. For example, additional Torque may be required in mountainous regions. Perhaps a smaller Engine can be used to save fuel if the driveline gearing is modified.

DRIVELINE BRAKING

Driveline Braking is used to augment the main service brake system. A technology called Engine Compression Braking allows the engine to remove horsepower from the driveline by compressing air. In addition to providing additional stopping power, driveline braking also reduces maintenance costs by prolonging the life of brake linings. This technology is often referred to in the industry as a “Jake Brake.”

NOTE: Engine Compression Braking is recommended for all CT660 driveline braking applications.

Engine Compression Brake HP vs. Engine RPM

Engine RPM	CT13		
	Level 1	Level 2	Level 3
1100	37	73	110
1300	57	113	170
1600	80	160	240
1700	110	220	330
1900	138	277	415
2100	157	313	470

Driver Selectable Engine Compression Brake Levels

NOTE: The driver can select levels 1-3 at anytime with a 3 way toggle switch, even during braking.

An alternate Driveline Braking option is a Transmission Retarder. This is an option within the Cat CX31 automatic Transmission. It cannot be used in conjunction with Engine Compression Braking because of driveline overload.

Engine RPM	Braking HP
900	100
1000	133
1100	164
1200	210
1300	265
1400	298
1500	335
1600	414
1700	550
1800	583
1900	615
2000	647
2100	680

Reference Equations (English Units)

$$\text{MPH} = \frac{60 \times \text{RPM}}{\text{M} \times \text{Ra} \times \text{Rt}} \qquad \text{*Miles per Hour}$$

$$\text{M} = \frac{60 \times \text{RPM}}{\text{Ra} \times \text{Rt} \times \text{MPH}} \qquad \text{*Tire Revolutions per Mile}$$

$$\text{Ra} = \frac{60 \times \text{RPM}}{\text{M} \times \text{Rt} \times \text{MPH}} \qquad \text{*Rear Axle Ratio}$$

$$\text{Rt} = \frac{60 \times \text{RPM}}{\text{M} \times \text{Ra} \times \text{MPH}} \qquad \text{*Transmission Gear Ratio (Top Gear)}$$

$$\text{RPM} = \frac{\text{MPH} \times \text{M} \times \text{Ra} \times \text{Rt}}{60} \qquad \text{*Revolutions per Minute (Engine)}$$

$$\text{Torque} = \frac{\text{HP} \times 5252}{\text{RPM}} \qquad \text{Torque in lbf-ft}$$

$$\text{Horsepower} = \frac{\text{Torque} \times \text{RPM}}{5252} \qquad \text{Horsepower in lbf-ft per Second}$$

*No Drop Box or Auxiliary Transmission.

● Vehicle Identification Number (VIN Structure)

Vehicle Identification Number (VIN Structure)

World Maker ID 1-3

- 3HP = Complete Truck
- 3HS = Complete Tractor
- 3HT = Incomplete Truck (Needs Body)

Model 4-5

- JG = CT660 6x4 112 BBC
- JK = CT660 6x4 122 BBC
- JN = CT660 4x4 122 BBC

Front Suspension Specifications

Multi Leaf Shackle

- Improved ride performance.
- Recommended for heavy duty applications (on/off road) 20,000 lb or lower.
- Can be used for heavy duty on-highway applications above 20,000 lb with limited off road.

Parabolic Taper Leaf

- Best ride.
- Lightest weight.
- Shock absorber required.
- Recommended for heavy duty applications (on/off road) 20,000 lb or lower.

Multi Leaf Slipper

- Most durable.
- Recommended for severe off road applications above 20,000 lb.

Rear Suspension Details

HENDRICKSON Walking Beam Suspension

HAULMAAX/HMX

- Recommended for dump, refuse, mixer, building /material supply and logging applications.
- Lightweight design for additional payload and route consolidation.
- Reduced maintenance with fewer bushings and no lubrication requirements.
- VariRate spring system provides superior combination of empty ride and loaded stability.
- Up to 17 in of diagonal articulation for greater off-road mobility.
- Capacities of 40,000 and 46,000 lb.

RT

- RT Series well suited for dump, refuse and building/material supply.
- Engineered with low maintenance bushings and spring assemblies.
- Operating in the field for over 85 years.
- RT capacities up to 65,000 lb.

RS/R

- Recommended for mining, refuse, logging and other specialty applications.
- R Series solid mount is an extra heavy-duty suspension where maximum roll stability is essential.
- RS rubber load cushions absorb shock and provide high roll stability for severe-service applications.
- Capacities up to 85,000 lb.

Rear Suspension Details (cont'd)

**Chalmers
Suspensions**

Walking Beam Suspension

800 Series

- Recommended for all types of applications, mixer, refuse, dump, logging, oilfield, mining, tanker, airport refueler and other vocational applications.
- Lightweight design, minimum maintenance, improved traction on uneven ground because axles do not transfer weight from one axle to the other.
- Loadguard hollow rubber spring is virtually indestructible, variable rate self damping for enhanced ride qualities laden and unladen. Greatly increased stability, combats side sway with wider spring centers.
- Full freedom of articulation both “parallel and diagonal.”
- Capacity range from 40,000 to 52,000 lb.

Air Suspension

HAS

- Suited for both on- and off-highway applications.
- Excellent ride quality.
- Approved for up to 25 percent off-highway use.
- Approved for use with lift axles.
- Optional inboard shocks available.
- Capacities of 40,000 and 46,000 lb.

PRIMAAX

- Approved for 100% off-highway use.
- Ideal for heavy-haul, dump, logging, refuse, mixer, building/material supply and crane applications.
- Optimized configuration helps improve handling and roll stiffness for expanded applications.
- Axle connection and torque rods help reduce torsional axle stress and drive-line vibration.
- Large-volume, low frequency air springs provide a smooth ride for on- and off-road usage.
- Up to 12.5 in of diagonal wheel articulation for superior mobility.
- Capacities of 46,000 lb and 52,000 lb.

Rear Suspension Details (cont'd)

Air Suspension for Tridem Axles

AD Series

- 100% off-highway rated performance.
- Designed for maximum durability in challenging operational environments.
- Non-torque reactive design maintains proper pinion angle to reduce unwanted driveline vibration and noise while helping increase driveline component life.
- Proprietary SAF-Holland rubber bushings and Sachs shocks are standard for increased durability and service life.

Developed for severe duty applications characterized by:

- Heavy vertical loads
- High gross combined weights
- High torque drive trains
- High center of gravity loads
- Significant off-highway travel

Severe and Heavy Duty Applications Include:

- Heavy haul/heavy construction
- Mine/Pit/Quarry
- Logging
- Oilfield
- Mixers and dumps for aggregate
- Asphalt and concrete transfer
- Straight truck in municipal, utility, and maintenance

Cold Planer

Sustainability:

- **Long-lasting lubricants and fluids** extend maintenance intervals, decreasing the amount of waste and filters contributed to environment.
- **Superior Cat® cutting tools last longer**, providing higher daily productivity with less fuel burn.
- **Available Cat Diamond Cutting Bits** last up to 80 times longer than conventional carbide bits.
- **Ecology drains** provide a simple means to drain machine fluids with a minimized risk of spillage.
- **Maintenance free Cat batteries** are recyclable.
- **Cat ACERT™ engines** meet applicable emission standards.
- **Cold planers recycle aggregate from worn out roads** for use in new roads, reducing the cost and energy needs required for excavating, processing and hauling virgin aggregate.

Features:

- **Cat ACERT engines.**
- **Up-cutting mandrels** provide cutting efficiency and improved bit life.
- **Excellent maneuverability** for productivity and job site flexibility.
- **Front-discharge conveyor** facilitates haul unit movement in congested urban applications.
- **Optimum weight-to-horsepower balance** for delivering maximum available horsepower to the cutter.
- **Computerized Monitoring System (CMS)** provides three warning levels for abnormal operating conditions.
- **Load control system** keeps machine operating at peak efficiency.
- **Water spray system** for dust control and bit cooling.
- **Optional Cat Grade and Slope** available for PM620 and PM622 models.

NOTE: Above figures are based on approximately 25 mm (1 in) depth of cut. For greater depths of cut, multiply the production rate by cutting depth. Figures are based on asphalt density of 2322 kg/m³ (145 lb/ft³). (As referenced on AsphaltPavement.org — the website of NAPA.)

MACHINE SELECTION

Prime considerations in selecting the proper cold planer model are:

- specifics of work to be done
- type of projects generally done by the contractor
 - City/Urban or Highway/Airport
- desired production capacities

PM102 Cold Planer

The Cat PM102 Cold Planer features compact dimensions and excellent maneuverability ideal for easy operation in urban applications. The machine performs controlled, full-depth removal of asphalt layers in a single pass and is also capable of concrete removal. The machine is available with a wheel or track undercarriage and features four steering modes for high maneuverability.

PM620 and PM622 Cold Planers

The Cat PM620 and PM622 Cold Planers are high-production, half-lane milling machines with excellent maneuverability and plenty of power to perform controlled full-depth removal of asphalt and concrete pavements in a single pass. The track-driven machine features four steering modes for high maneuverability. The PM620 features a 2.0 m (79") cutting width and performs well in urban environments or in applications where great maneuverability is required. The PM622 features a 2.2 m (88") cutting width and is ideal for high-production applications such as main line milling.

Cold Planer Characteristics (Highway/Airport)

Highway/Airport work requires high-volume cold planers. The PM620, PM622 and other high horsepower half-lane cold planers are being used more on Highway/Airport projects. Users like to have one machine that can work successfully on high production jobs then switch to city/urban applications.

Cold Planer Characteristics (City/Urban)

All Cat cold planers are four-track, front discharge models. Front discharge cold planers make traffic control easier in congested quarters. The trucks travel forward in the same direction as the cold planer. The trucks move in and out of traffic faster increasing production.

COLD PLANING FUNDAMENTALS

Definition

Cold planing is automatically controlled cold milling to restore the pavement surface to a specified grade and slope; remove bumps, ruts, and other imperfections; and leave a textured surface which can be opened immediately to traffic or overlaid with new pavement materials.

Production and Tooth Wear

Because pavement materials vary, so do production and tooth wear. While predicting the exact production rate and tooth wear on a particular job is difficult, general guidelines are available.

Production depends on the milling rate (the speed at which the cold planer moves forward). The machine's forward speed is determined, primarily, by aggregate type, asphalt bond strength and depth of cut. When milling asphalt pavement, the cold planer's teeth essentially are breaking the bond between asphalt-coated aggregate, not actually fracturing the aggregate itself. A pavement made with a mix containing a high percentage of fine aggregate and a high asphalt content is more difficult to mill than a pavement with a high percentage of coarse aggregate.

A dense or fine mix usually requires more power at the cutting drum, limiting the cold planer's forward speed. Decreased speed lowers production, and the tough bond between the small aggregate particles causes increased cutting-tooth wear. Lower production and higher tooth wear result in increased unit costs.

Cutting depth affects power demand at the drum and helps determine the cold planer's forward speed. However, production increases, to a point, as the depth of cut increases. For example, changing from a 25 mm (1 in) cut to a 51 mm (2 in) cut slows the machine only slightly but doubles the amount of material produced.

As the cut increases beyond the machine's peak-production depth, the reduced forward speed begins to offset the production gains of the deeper cut. For example, production at a 152 mm (6 in) cutting depth and slow speed may be no greater than cutting at a 76 mm (3 in) depth and a much faster speed.

Low Density Asphalt

Depth		PM620, PM622	
mm	in	m/min	ft/min
51	2	40	130
101	4	32	105
127	5	21	70
178	7	12	40
254	10	6	20
305	12	5	15

High Density Asphalt

Depth		PM620, PM622	
mm	in	m/min	ft/min
51	2	32	105
101	4	26	85
127	5	18	60
178	7	9	30
254	10	5	15
305	12	4	12

As long as the cold planer maintains a productive forward speed, deeper cuts will yield greater production and tend to lower tooth cost. Tooth wear does not increase in direct proportion to production when the machine is working in an efficient range.

Tooth wear at various depths for a given material is affected by how long the tooth remains in the cut. Because the teeth are mounted on a circular drum, each tooth cuts through the pavement in an arc. The tooth arc at a 102 mm (4 in) cutting depth, however, is not four times longer than at a 25 mm (1 in) cutting depth, even though production may be four times greater. The cutting arc at 102 mm (4 in) is approximately twice as long as that at 25 mm (1 in).

The peak cutting depth for a particular cold planer on a specific job is best determined by examining production, and subsequent costs, of a single deep cut versus multiple passes at a shallow depth.

APPLICATIONS

Although new applications for cold planers are being discovered, most work can be classified in six general categories:

Leveling and Bonding

This application removes a layer of pavement to eliminate potholes, ruts, bumps and other surface imperfections. The cold planer leaves a level, textured surface ideal for bonding to a new, thin overlay of asphalt or concrete. The surface has an interlocking texture with double the bonding area of a conventional smooth pavement. The textured surface and overlay form a monolithic bond, eliminating the shear plane that causes pavement layers to move and separate. Thinner overlays can be used, making the technique more economical than traditional overlay methods.

Surface Refinishing

Rough pavement can also be cold planed to specified grade and slope, providing a new riding surface without adding new paving materials. This application is particularly useful when base and sub-base are in good shape, or when several layers have been added to the roadway over the years. Roads can be cold planed during cold, wet months and reopened immediately. New overlays can be added whenever weather permits. This lengthens the practical working season for many contractors. The cold planer can also be used to correct expansion joint faults and pavement cracks.

Surface Repair

This category generally requires deeper cutting than leveling. It consists of removing isolated distressed pavement sections down to subbase, if necessary, prior to adding new overlay materials. Since the cutter mandrel on Cat cold planers cuts forward and upward, there's no damaging impact to the underlying base.

Pavement Removal

Pavement buildup is a problem that plagues most older streets, roads and highways. As overlays are added, curbs and drains are buried — creating drainage problems. Overhead clearances are dangerously reduced ... and additional weight is added to over-passes and bridges. Cold planing is an economical method of curing all these problems.

Surface Texturing

Serious accidents increase when pavement becomes slick from wear. The textured surface produced by cold planing is highly skid-resistant and has dramatically reduced hydroplaning characteristics.

Pavement Mining

Cold milling has made it practical to actually “mine” deteriorated pavement materials from existing roads and streets. The cold planer produces an ideally-sized asphalt or concrete material which can be recycled in a variety of ways. Depending on type, age and condition of pavement, the largest cold planer can reclaim up to 900 tons of material per hour.

COLD PLANER USE BY PROJECT TYPE

Applications	Highway/Airport	City/Urban
Planing (Milling)	<ul style="list-style-type: none"> ● To establish grade and slope. ● Remove excess pavement. 	<ul style="list-style-type: none"> ● To establish proper grade and slope. ● To establish new grade and slope.
Partial Removal	<ul style="list-style-type: none"> ● For use with hot mix recycle. ● Remove pavement irregularities. ● Texture for skid resistance. 	<ul style="list-style-type: none"> ● To correct drainage and curb reveal. ● To lower elevation at overpass. ● For use with hot recycle. ● Eliminate leveling course.
Full Depth Removal	<ul style="list-style-type: none"> ● Total rebuild. RAP used for base or hot recycle. ● Cold recycle. This requires additional surface treatment. 	<ul style="list-style-type: none"> ● Total rebuild. RAP used for base or hot recycle. ● Cold recycle. Requires additional surface treatment.
Texturing	<ul style="list-style-type: none"> ● For skid resistance and improved bond when overlay is applied. 	<ul style="list-style-type: none"> ● For skid resistance and improved bond when overlay is applied.
Leveling		<ul style="list-style-type: none"> ● At intersections to remove bumps, shoving and improve drainage.
Special	<ul style="list-style-type: none"> ● Joint and crack repair. ● Cut rumble grooves on shoulders of bridge approaches. ● Concrete removal. 	<ul style="list-style-type: none"> ● Intersection defect repair. ● Pothole repair. ● Railroad crossing repair. ● Tight radius profiling around manhole covers, etc. ● Pavement adjustments (transitions from existing pavements to new overlays).

RM300 and RM500B:

The RM300 and the RM500B combine superior performance and reliability to achieve the most demanding job specifications while maximizing machine uptime. With many enhanced features and options, the RM300 and the RM500B are designed to work well in both full depth reclamation and soil stabilization applications.

Rotary Mixers**Sustainability:**

- Long-lasting lubricants and fluids extend maintenance intervals, decreasing the amount of waste and filters contributed to environment.
- Ecology drains provide a simple means to drain machine fluids with a minimized risk of spillage.
- Maintenance free Cat batteries are recyclable.
- Cat ACERT engines meet applicable emission standards.
- Rotary Mixers recycle the materials into aggregate on site. That reduces overall fuel consumption and engine emissions.
- Rotary Mixers and the reclamation process can eliminate the need for an excavator and motor grader at most job sites.
- Rotary Mixers can reclaim and stabilize simultaneously. If stabilization is required, the agent can be placed on top of the reclamation project. The Rotary Mixer then makes a single pass, mixing the stabilizer with the material beneath the surface. At the same time, it reduces the aggregate to its original size. All this is accomplished with one machine — in one pass.
- The reclamation and stabilization process can easily incorporate environmentally sensitive sealants. Now the life of the road bases can be extended without fear of harming wildlife.

- The reclamation process usually is quicker than full replacement, allowing roads to open sooner. This means fewer traffic jams — a quality of life issue as well.
- Reclamation and stabilization dramatically extend the life of roads. Some contractors conservatively estimate that a reclaimed/stabilized base will help a recycled road last 30 to 40 years. Extending that life is an enormous cost-saver, and also results in the use of less energy.

RM300 Features:

- **Maximum Production** ... from Cat ACERT engines.
- **Highly Efficient** ... load-sensing propel system helps prevent overloading while allowing continuous work near rated horsepower.
- **Extremely Versatile** ... interchangeable rotors provide both reclamation and stabilization capabilities.
- **Consistent Blending** ... automatic depth control, mid-mounted mixing chamber and multi-speed rotor drive combine for optimum blending and increased production.

RM500B Features:

- **Maximum Production** ... from Cat ACERT engines.
- **Highly Maneuverable** ... separate hydraulic pump provides hydraulic flow to large displacement motors on each rear wheel.
- **Versatility** ... choice of three rotors for full depth reclamation or soil stabilization.
- **Reliability** ... field proven Cat components maximize machine availability.
- **Standard all-wheel drive with advanced traction control system** for maximum traction.
- **Rotating operator's station with handwheel steering and integrated touchscreen display** provides operator with fingertip control, high visibility and exceptional comfort.

Rotor Options for RM300 and RM500B

Rotor	Maximum Depth of Work	No. of Bits/Tools	Direction of Cut	Stabilization	Reclamation
Universal 406 mm (16")*	406 mm 16"	200	Up	X	X
Universal 457 mm (18")**	457 mm 18"	200	Up	X	X
Soil	508 mm 20"	238	Up	X	
Combination	508 mm 20"	114	Up	X	
Spade	457 mm 18"	58	Up	X	

*Designed to produce maximum breakout force, the Universal Rotor 406 mm (16") performs well in severe asphalt cuts.

**The Universal Rotor 457 mm (18") is designed to provide maximum mixing depth and has lower breakout force compared to the Universal Rotor 406 mm (16").

Rotor Options:

Some rotor options are not available in certain markets.

- **Soil Rotor** is designed primarily for use in soil stabilization.
- **Combination Rotor** is designed primarily for use in soil stabilization with a secondary application in light cuts of asphalt reclamation.
- **Universal Rotor** can be used for either reclamation or stabilization.
- **Spade Rotor** is designed for soil stabilization applications.

PRODUCTION ESTIMATING

The maximum cutting depth is 381 mm (15 in) for the RM300 and 457 mm (18 in) for the RM500B. The RM300 can mix up to 457 mm (18 in). In addition, the cutting width of their rotors is 2.4 m (8 ft). The following formulas allow you to determine the production in square yards (yd²)/minute or cubic yards (yd³)/minute.

Production in square yards (yd²) per minute

$$\text{yd}^2/\text{min} = \frac{\text{FPM of travel speed}}{1.125}$$

$$\frac{9 \text{ ft}^2/\text{yd}^2}{8 \text{ ft Cutting width}} = 1.125 \text{ (This is a constant value for an eight foot wide rotor)}$$

Gallons of additive (for units with pump and metering additive system)

$$\frac{\text{GPM}}{\text{yd}^2/\text{min}} = \text{gal}/\text{yd}^2$$

Or, if required additive amounts are known, you can determine necessary travel speed as shown:

$$\frac{\text{GPM}}{\text{gal}/\text{yd}^2} = \text{yd}^2/\text{min}; \text{yd}^2/\text{min} \times 1.125 = \text{ft}/\text{min}$$

Production in Cubic Yards (yd³) per minute

$$\frac{\text{FPM of travel speed}}{1.125} \times \frac{\text{Cutting or mixing depth in inches}}{36} = \frac{\text{yd}^3}{\text{min}}$$

Production in Tons per Minute

$$\text{yd}^3/\text{min} \times \frac{\text{Wt. of Material per yd in lbs}}{2000 \text{ lb}/\text{ton}} = \text{tons}/\text{min}$$

Abbreviations

FPM = Feet Per Minute

GPM = Gallons Per Minute

Asphalt Pavers**Sustainability:**

- Long-lasting lubricants and fluids extend maintenance intervals, decreasing the amount of waste and filters contributed to environment.
- Ecology drains provide a simple means to drain machine fluids with a minimized risk of spillage.
- Maintenance free Cat batteries are recyclable.
- Cat ACERT engines meet applicable emission standards.
- Proprietary undercarriage design on Mobil-Trac™ pavers significantly reduces track belt wear, reducing frequency of replacement.
- Cat electric-heated screeds provide a reduction in engine emissions, which not only reduces the impact to the environment, but helps prevent soot build-up on indicators and decals — for enhanced safety.
- Electric-heated screeds produce less noise, which is appreciated by the crew as well as those who work and live near the construction sites.
- Electric-heated screeds, unlike their diesel counterparts, don't require a constant flame — another way emissions are reduced, and operators spared some heat.
- Electric-heated screeds are lighter, which means the paver consumes less fuel.
- Electric-heated screeds warm up quickly, another energy saver.
- Pavers equipped with Eco-mode can reduce engine speed to increase fuel efficiency during normal operation conditions.
- Pavers equipped with automatic engine speed control can be programmed to idle the engine when machine is in neutral for a predetermined amount of time, reducing fuel burn.

Features:

- **Variable width screeds** available.
- **Self-dumping hydraulic hoppers** are heavy-duty and high capacity.
- **Soldered and molded** electrical connections.
- **Self diagnostics** on propel and feeder systems.
- **Electrically heated screeds.**
- **Dual independent operating stations.**
- **Mobil-Trac undercarriage** provides speed of a wheeled paver with maneuverability of a track paver.
- **Optional Cat Grade and Slope** is integrated with the paver.
- **Large generators** deliver fast heat with less fuel consumption.*
- **One-touch functions** for cleanout/warm up mode.*
- **One-touch Auto-fill function.***
- **One-touch feeder system activation.***
- **Advanced generator diagnostics** helps determine heating element life.*

*Feature available on F Series pavers only.

ASPHALT PAVING CHARTS

These charts will assist you when trying to match plant output with paving speeds. Keep in mind when using these charts, it will be at 100% efficiency. If you know efficiency, multiply T.P. hour × efficiency. (Example: 75% efficiency at 300 T.P.H. – 300 × 0.75 = 225 T.P.H.)

Production in tons/hr with 1" compacted mat

Speed	Paving Widths

Formula:

$$\text{Percent} = \frac{\text{Inches per foot} \times 100}{12}$$

Inches in decimals of a foot

1/16 = .0052	1 = .0833
3/32 = .0078	2 = .1667
1/8 = .0104	3 = .2500
3/16 = .0156	4 = .3333
1/4 = .0208	5 = .4167
5/16 = .0260	6 = .5000
3/8 = .0313	7 = .5833
1/2 = .0417	8 = .6667
5/8 = .0521	9 = .7500
3/4 = .0625	10 = .8333
7/8 = .0729	11 = .9167

Vibratory and Pneumatic Tire Compactors

Sustainability:

- Long-lasting lubricants and fluids extend maintenance intervals, decreasing the amount of waste and filters contributed to environment.
- Ecology drains provide a simple means to drain machine fluids with a minimized risk of spillage.
- Maintenance free Cat batteries are recyclable.
- Cat ACERT engines meet applicable emission standards.
- Biodegradable oil option available.

General Compactor Features:

- **Routine maintenance** simplified by grouped service points and easy access to service areas.
- **Operator stations** designed for maximum comfort, easy control, and optimal visibility.
- **Direct hydrostatic drive to front (drums or wheels) and rear (drums or wheels)** provides dependable, responsive, propulsion effort and maximum gradeability. (Does not include pneumatic tire compactors.)
- **Eco-mode standard equipment** on B Series Vibratory Soil Compactors and Double Drum Rollers reduces fuel consumption.

Vibratory Compactor Features:

Single Drum

- **Dual pump system** delivers positive tractive effort to both drum and rear wheels, regardless of underfooting. This increases the machine's ability to maneuver in a wide variety of soil types and conditions and improves gross gradeability.
- **Limited slip high traction differential** is standard on all units for best traction of rear tires.
- **Optional heavy-duty front-mounted blade** with reversible cutting edge is available to allow backfilling and leveling during compaction.
- **ROPS (Roll Over Protective Structure)** standard on all units. Enclosed cabs with EROPS rating available as an option.

- **Optional Cat Compaction Control** featuring exclusive Machine Drive Power (MDP) or CMV (accelerometer-based) measurement scalable to include GNSS mapping and recording.
- **Adjustable jaw-type cleaner bar** keeps drums clean between pads during forward and reverse movement.

Double Drum and Combi

- **Vibration automatically ceases before machine comes to a stop** to help produce a smooth, flawless mat surface.
- **Close side clearances** allow compactors to work close to curbs, walls and other obstructions.
- **Large, rust-proof water tanks and pressure spray system** provide hours of reliable operation between fill-ups.
- **Emulsion system** available for combi compactor rear tires to prevent materials sticking to tires.
- **ROPS (Roll Over Protective Structure)** available on all models. Enclosed cabs with EROPS rating available on some models.
- **Optional Cat Compaction Control** featuring GNSS mapping of pass count and mat surface temperature.

Pneumatic Tire Compactor Features:

- **All wheel oscillation.** Front and rear tires provide even wheel loads regardless of evenness underfoot.
- **High drive propel system.** Completely hydrostatic with drive motors and brakes located in mainframe away from contamination and damage.
- **Ballast compartments** are easily accessible for quick loading and are located to provide balanced wheel/weight ratio.
- **Single-lever hand control** of forward and reverse movement makes smooth rolling easy.
- **Optional Cat Compaction Control** featuring GNSS mapping of pass count and mat surface temperature.

NOTE: All models and options are not available in all markets.

NOTES:

1. Each tire type has a unique pressure distribution which varies with both tire inflation pressure and wheel load. The distribution of pressure along both transverse and longitudinal profiles is rarely uniform.
2. The measurements in this table represent the peak pressures measured in a transverse profile at each of the ballast conditions at maximum tire inflation pressure.
3. For most applications, it can be assumed that normal operation of the pneumatic compactor will result in the ground being subjected to pressures near the maximum during at least one machine pass.

NOTES:

1. Each tire type has a unique pressure distribution which varies with both tire inflation pressure and wheel load. The distribution of pressure along both transverse and longitudinal profiles is rarely uniform.
2. The measurements in this table represent the peak pressures measured in a transverse profile at each of the ballast conditions at maximum tire inflation pressure.
3. For most applications, it can be assumed that normal operation of the pneumatic compactor will result in the ground being subjected to pressures near the maximum during at least one machine pass.

The tables in this section give production estimates for the following assumed conditions:

Nominal machine travel speed: 6.4 km/h (4.0 mph)

Overlap of rolling width: 15.2 cm (6.0 inches)

Table values give **representative** production rates for three common construction conditions: trenches, roads, and wide areas (> 15 m, or 50 ft).

Model	Drum Width		Lift Thickness		Passes Required	Production Estimates			
	cm	in	cm	in		3.7 m (12 ft) Trench	9.15 m (30 ft) Road Base	Wide Areas

Travel Speed Efficiency

Adjusting the Production Estimate

If the assumed conditions are not close to the actual construction conditions, the production estimates should be corrected. The production estimate from the table can be adjusted for ‘actual’ construction conditions by applying adjustment factors:

$$Q \text{ (actual)} = Q \text{ (assumed)} \times F_s \times F_t \times F_p$$

- Where: Q (actual) = adjusted productivity
- Q (assumed) = productivity from table based on assumed conditions
- F_s = adjustment for machine speed
- F_t = adjustment for layer thickness
- F_p = adjustment for no. of passes

The adjustment factors are determined by comparing the ‘actual’ conditions to the ‘assumed’ ones:

- F_s = actual speed/assumed speed
- F_t = actual thickness/assumed thickness
- F_p = assumed passes/actual passes

Metric example

Actual Conditions — An 9.15-meter (full road width) base aggregate job is being completed with a compacted thickness of 15 cm. A CS44B is being used, operating at 4.0 km/h, and making 6 passes to achieve the desired compaction. The roller is overlapping its passes 6 inches.

For a 9.15-meter road base the table gives a CS44B productivity of 249 m³/hr. Since the speed, thickness, and passes are *different* from the assumed conditions, we should adjust this estimate:

	Assumed	Actual
Speed	6.4 km/h	4.0 km/h
Thickness	10.2 cm	15 cm
Passes	4 passes	6 passes

- F_s = 4.0 km/h/6.4 km/h = 0.6
- F_t = 15 cm/10.2 cm = 1.5
- F_p = 4 passes/6 passes = 0.7

The estimated production is adjusted using these factors:

$$Q \text{ (actual)} = 249 \text{ m}^3/\text{hr} \times 0.6 \times 1.7 \times 0.7 = 178 \text{ m}^3/\text{hr} \text{ (233 yds}^3/\text{hr)}$$

English example

Actual Conditions — An wide area commercial site development job is being compacted in lifts of 8 inches. A CP56B is being used, operating at 4.0 mph, and making 4 passes to achieve the target density.

First, the table gives a CP56B productivity of 847 yds³/hr. Since lift thickness and passes required are *different* from the assumed conditions, we should adjust this estimate:

	Assumed	Actual
Speed	4.0 mph	4.0 mph
Thickness	12 inches	8 inches
Passes	6 passes	4 passes

- F_s = no correction necessary
- F_t = 8 inches/12 inches = 0.7
- F_p = 6 passes/4 passes = 1.5

The estimated production is adjusted using these factors:

$$Q \text{ (actual)} = 847 \text{ yds}^3/\text{hr} \times 0.7 \times 1.5 = 890 \text{ yds}^3/\text{hr} \text{ (680 m}^3/\text{hr)}$$

Notes on Productivity:

- For jobs that are relatively narrow, especially road construction jobs, it is important to understand that certain widths of construction will be more productive than others for a given compactor. A productive construction width will make the most use of each side by side pass required by the compactor in order to cover the width.
- Production estimates should be adjusted further if the length of the compaction cycles are shorter than 75 m (250 ft). Refer to the Travel Speed Efficiency chart to determine efficiency E_{TS}. For example, a compactor traveling at 6.4 km/h (4 mph) operating at cycle lengths of 150 ft has an E_{TS} of 0.91. Multiply Q (actual) by E_{TS}.

The table in this section gives production estimates for the following assumed conditions:

Compacted Layer Thickness	51 mm	2 in
Maximum Vibratory Frequency*	—	—
Impacts Spacing	33 impacts/m	10 impacts/ft
Passes per Machine Width	2	2
Compacted Material Density	2483 kg/m ³	155 lb/ft ³
Overlap of Rolling Width	152 mm	6 in
Overhang at Lane Edge	76 mm	3 in
Efficiency	75%	75%

*Maximum vibratory frequency varies by machine, refer to table.

Table values give **representative** production rates for common construction widths. If the actual width falls between two assumed widths, use the higher number to estimate production. Minor adjustments can normally be made in the rolling method to reach this higher production: reduce overlap or overhang, increase speed, or increase the cycle time.

Model	Vibration Frequency	Units	PAVING WIDTH						
			1.8 m 6 ft	2.4 m 8 ft	3.0 m 10 ft	3.7 m 12 ft	4.3 m 14 ft	4.9 m 16 ft	5.5 m 18 ft

Example

Actual Conditions — A 3.7 m (12 ft) lane is being paved with a compacted asphalt thickness of 10 cm (4 in). A CB54B is operating with a frequency of 42 Hz (2520 vpm) and 46 impacts per meter (14 impacts per ft) and making 4 passes to achieve target density. The roller is overlapping its passes 15 cm (6 in) and is overhanging the edges by 7.5 cm (3 in).

First, the table gives a CB54B productivity of 343 Tonnes/hr (378.6 tons/hr) for a 3.7 m (12 ft) paving width. Since the actual vibratory speed, thickness, impact spacing and passes are different from the assumed conditions, the estimate should be adjusted.

	Assumed	Actual
Vibratory Speed	63.3 Hz 3800 vpm	42 Hz 2520 vpm
Impact Spacing	33 impacts/m 10 impacts/ft	46 impacts/m 14 impacts/ft
Thickness	5 cm 2 in	10 cm 4 in
Passes	2	4

$$F_s = 42 \text{ Hz (2520 vpm)} / 63.3 \text{ Hz (3800 vpm)} = 0.66$$

$$F_i = 33 \text{ impacts/m (10 impacts/ft)} / 46 \text{ impacts/m (14 impacts/ft)} = 0.71$$

$$F_t = 10 \text{ cm (4 in)} / 5 \text{ cm (2 in)} = 2.0$$

$$F_p = 2 \text{ passes} / 4 \text{ passes} = 0.5$$

The actual, or adjusted, production estimate can then be determined from the following:

$$Q \text{ (actual)} = 343 \text{ Tonnes/hr (378.6 tons/hr)} \\ \times 0.66 \times 0.71 \times 2 \times 0.5 = \\ 161 \text{ Tonnes/hr (177.4 tons/hr)}$$

Notes on Productivity:

- Higher speed usually results in lower density achieved per pass.
- Productivity on uphill slopes may be reduced.
- Tabulated production estimates assume that 1 pass is used for re-positioning the machine at the beginning of the next run.

The tables in this section give production estimates for the following assumed conditions:

	Hot Mix Asphalt		Soil and Aggregate		Cold In-Place Recycled Asphalt	
Compacted Layer Thickness	51 mm	2 in	152 mm	6 in	203 mm	8 in
Maximum Propelling Speed	8 km/h	5 mph	8 km/h	5 mph	4.8 km/h	3 mph
Passes per Machine Width	4		4		6	
Compacted Material Density	2486 kg/cm ³	155 lb/ft³	2085 kg/cm ³	130 lb/ft³	2246 kg/cm ³	140 lb/ft³
Overlap of Rolling Width	152 mm	6 in	152 mm	6 in	152 mm	6 in
Overhang at Lane Edge	76 mm	3 in	76 mm	3 in	76 mm	3 in
Cycle Time (2 passes)	120 seconds		120 seconds		120 seconds	

Table values give **representative** production rates for common construction widths. If the actual width falls between two assumed widths, use the higher number to estimate production. Minor adjustments can normally be made in the rolling method to reach this higher production: reduce overlap or overhang, increase speed, or increase the cycle time.

Example

Actual Conditions — A 7.3 m (23'11") (full road width) base aggregate job is being completed with a compacted thickness of 200 mm (8 in). A CW14 is being used, operating at 6.5 km/h (4 mph), and making 6 passes achieve the desired compaction. The roller is overlapping its passes 152 mm (6 in).

First, the table does not show production for 7.3 m (23'11") so use the greatest width on the table: 5.5 m (18'1"). The table gives a CW14 productivity of 778.4 Tonnes/hr (858.0 tons/hr) for this paving width. We can expect that the actual productivity for 7.3 m (23'11") will be slightly higher than that. Since the speed, thickness, and passes are *different* from the assumed conditions, we should adjust this estimate:

	Assumed		Actual	
Speed	8 km/h	5 mph	6.5 km/h	4 mph
Thickness	152 mm	6 in	200 mm	8 in
Passes	4		6	

$$F_s = 6.5 \text{ km/h} / 8 \text{ km/h} (4 \text{ mph} / 5 \text{ mph}) = 0.8$$

$$F_t = 200 \text{ mm} / 152 \text{ mm} (8 \text{ in} / 6 \text{ in}) = 1.3$$

$$F_p = 4 \text{ passes} / 6 \text{ passes} = 0.7$$

The estimated production is adjusted using these factors:

$$Q (\text{actual}) = 778.4 \text{ Tonnes/hr} (858.0 \text{ tons/hr}) \times 0.8 \times 1.3 \times 0.7 = 567 \text{ Tonnes/hr} (625 \text{ ton/hr})$$

Notes on Productivity:

- Ballast weight and tire pressure can significantly affect performance of a pneumatic tire compactor. Refer to machine specifications to choose the best configuration.
- Productivity on uphill grades and very thick layers (>127 mm, or 5 in) may be reduced due to a necessary reduction in speed.
- The 11-tire configuration for the CW14 is designed only for chip-and-seal applications. It is not recommended in other applications.

PIPELAYERS

CONTENTS

Features	14-1
Specifications	14-2
Lifting Capacities	14-4
Drawbar Pull Charts	14-7
Travel and Hook Speeds	14-9
Application	14-10
Extreme Slope Operation	14-12

Features:

- **Hydrostatic transmission** on PL61.
- **Planetary power shift** transmission on PL72, PL83 and PL87 models.
- **Kick-out helps prevent boom bending** as boom approaches near-vertical.
- **Sealed and Lubricated Track.**
- **Simplified Controls** for all functions including raise, lower, quick-drop and power down, variable range and speed adjustments.
- **Modular design of major components and accessory drive system** for simplified repair.
- **Separate, self-energizing brakes** for boom and hook winches.
- **Positive** track pin retention (PL83 and PL87).
- **Hydraulic Drawworks** with two independently driven hydraulic motors for boom and hook winches.

PL61

LIFTING CAPACITY* 5.49 m (18'0") BOOM

***Specified Equipment:**

- 16 mm (5/8") diameter wire rope.
- 183.3 kN (41,200 lb) minimum breaking strength.
- 3 part load line.
- 3 part boom line.
- 1231 kg (2714 lb) counterweight extended.
- Standard 5.49 m (18'0") Boom.
- Total operating weight
 - Narrow — 17 000 kg (37,480 lb).
 - LGP — 17 800 kg (39,242).

KEY

- A — Lift capacity at tipping point per ISO 8813
- B — Rated load capacity per ANSI/ASME B30.14
- C — Working range per ANSI/ASME B30.14

PL72

LIFTING CAPACITY* 6.1 m or 7.3 m (20'0" or 24'0") BOOMS

***Specified Equipment:**

- 19 mm (3/4") diameter wire rope.
- 261.66 kN (58,800 lb) minimum breaking strength.
- 4 part load line.
- 4 part boom line.
- 5073 kg (11,184 lb) counterweight extended.
- Standard 6.1 m (20'0") Boom.

KEY

- A — Lift capacity at tipping point*
- B — Rated load capacity*
- C — Working range*

*Per ISO 8813:1992.

NOTE: ISO stands for the International Standards Organization. ANSI stands for American National Standard Institute.

PL83

LIFTING CAPACITY* 7.3 m, 8.5 m (24'0", 28'0") BOOMS

***Specified Equipment:**

- 19 mm (3/4") diameter wire rope.
- 26 672 kg (58,800 lb) minimum breaking strength.
- 6 part load line.
- 5 part boom line.
- 10 826 kg (23,817 lb) counterweight extended.
- Standard 7.3 m (24'0") Boom.
- Total operating weight 48 444 kg (106,800 lb).

KEY

- A – Max lift capacity per ISO 8813
- B – Rated load per ANSI/ASME B30.14
- C – Working range per ANSI/ASME B30.14

NOTE: ISO stands for the International Standards Organization. ANSI stands for American National Standard Institute.

PL87

LIFTING CAPACITY* 8.5 m (28'0") BOOM

***Specified Equipment:**

- Load: 19 mm (3/4") dia. wire rope 26 672 kg (58,800 lb) minimum breaking strength.
- Boom: 19 mm (3/4") dia. wire rope 26 672 kg (58,800 lb) minimum breaking strength.
- 8 part load line.
- 5 part boom line.
- 13 903 kg (30,587 lb) counterweight extended.
- Standard 7.3 m (24'0") Boom.
- Total operating weight 54 485 kg (120,123 lb).

KEY

- A — Max lift
- B — Rated lift
- C — Working range per ANSI/ASME B30.14

NOTE: ISO stands for the International Standards Organization. ANSI stands for American National Standard Institute.

PL61

NOTE: Usable pull will depend upon weight and traction of equipped tractor.

PIPELAYER APPLICATION CALCULATIONS:

Typical pipelayer applications on flat, firm underfoot conditions

- PL61** laying 8" to 16" pipe
- PL72** laying 16" to 24" pipe
- PL83** laying 24" to 36" pipe
- PL87** laying 36" to 56" pipe

The chart above provides general information representing typical pipelayer applications. While the following scenario explores many of the variables involved in pipelaying it does not cover all the possible variables that must be considered by pipelaying contractors.

When sizing pipelayers for an application there are many considerations other than the machine's SAE rated lift capacity. These include but are not limited to:

- pipe diameter and weight per linear foot
- ditch width and depth
 - ditch width is typically $2 \times$ pipe diameter
 - ditch depth is typically $>2.5 \times$ pipe diameter
- distance from the ditch (safe slope) required by soil stability conditions
 - varies by local ground conditions but typically 2:1 (meaning the pipelayer must be $2 \times$ ditch depth from the ditch edge)

- acceptable distance between pipe lifting points while suspended (to prevent bending)
 - determined by the pipe's bending characteristics.
 - If the lifting points are too far apart a pipe can sag enough due to its own weight that it will damage itself.
- the operating safety factor desired by the contractor
- the length of pipe that will need to be suspended while laying-in
 - determined by pipe bending characteristics, terrain, etc.
- ground conditions, road bed preparation

An important consideration is the necessary load overhang. This is the distance from the center of the pipe to the tractor's left track rail. The load overhang required for an application can be estimated by:

- load overhang = safe slope × ditch depth + (0.5 × ditch width)

The pipelayer's rated load capacity at a specific load overhang (per ANSI/ASME B30.14) can be found in the load capacity graphs in this section of the performance handbook. Once the load capacity is determined the maximum lift point spacing can be estimated by:

- max lift point spacing = $\frac{\text{load capacity at load overhang}}{\text{safety factor} \times \text{pipe weight per linear foot}}$

The maximum distance between pipe lift points (based on pipe bending characteristics) may be a shorter distance than the maximum spacing between lift points as calculated based on pipelayer load capacity. If this is the case, then in order to avoid damaging the pipe, the shorter distance should be considered to be the maximum distance between pipelayers.

As an example, consider a project involving 0.5" wall 24" diameter pipe which has a weight per linear foot of 125.5 lb and the soil has a safe slope of 2. Using the above formulas:

- the ditch depth would be 3 × 2 ft = 6 ft deep
- the ditch width would be 2 × 2 ft = 4 ft
- the load overhang would be 2 × 6 ft + (0.5 × 4 ft) = 14 ft

Using the PL72's lift capacity chart we find that the PL72 has an ANSI rated load capacity of approximately 21,250 lb at a 14 ft load overhang.

When using rated load numbers it is important to understand that the lift capacity charts are based on SAE and ANSI test procedures that rate pipelayers on level, concrete surfaces. Working on softer underfoot conditions, working on slopes, (and other) can greatly reduce the pipelayer's load capacity.

If the contractor employs a safety factor of 2 then the maximum spacing between pipe lift points is:

$$\frac{21,250 \text{ lb}}{2 \times 125.5 \text{ lb/ft}} = 84.7 \text{ ft}$$

It is important to remember that this is the distance between the lift points, not the distance nose-to-tail between pipelayers. For this example, assume that 500 ft of pipe must be suspended during the laying-in process.

$$\frac{500 \text{ ft}}{84.7 \text{ ft per pipelayer}} = 5.9 \text{ which means that six pipelayers are needed}$$

The number of pipelayers required could also be determined by a second method:

$$\frac{\text{ft of pipe suspended} \times \text{pipe weight per ft} \times \text{safety factor}}{\text{rated load at overhang}}$$

In this case:

$$\frac{500 \text{ ft} \times 125.5 \text{ lb/ft} \times 2}{21,250 \text{ lb}} = 5.9 \text{ which again implies six pipelayers}$$

If, in this same example, soil conditions required a safe slope of 2.33 then the load overhang would have been 16 ft. At this load overhang the 90,000 lb lift pipelayer's rated load capacity is approximately 18,125 lb. Using the equations above, this results in 72.2 ft between lift points which means that seven 90,000 lb lift pipelayers are now necessary. Using the second method:

$$\frac{500 \text{ ft} \times 125.5 \text{ lb/ft} \times 2}{18,125 \text{ lb}} = 6.9 \text{ again implying that seven 90,000 lb lift pipelayers are needed}$$

Rather than adding another pipelayer, PL83's could be used. At a 16 ft load overhang the PL83 has a rated load capacity of 29,400 lb. This translates to 117.1 ft between lift points. If the pipe's bending characteristics will allow this space between lift points, the job could be done with only five PL83's.

EXTREME SLOPE OPERATION

The maximum fore and aft grade in static condition on which each track-type tractor or pipelayer will maintain proper lubrication is 45 degrees (100%). Consult Operation & Maintenance Manual (if applicable) for POWER TRAIN fluid level overfill requirements for operation on extreme slopes. Extreme slope operation is anytime the slope exceeds 25° (47%).

When working sidehills and slopes, consideration should be given to the following important points:

- Speed of travel — At higher speeds, inertia forces tend to make the tractor less stable.
- Roughness of terrain or surface — Ample allowance should be made where the terrain or surface is uneven.
- Mounted equipment — Bulldozers, sidebooms, winches, and other mounted equipment cause the tractor to balance differently.
- Nature of surface — New earthen fills may give way with the weight of the tractor. Rocky surfaces may promote side slipping of tractor.
- Track slippage due to excessive loads — This may cause downhill track to “dig in,” increasing angle of tractor.

The ENGINE should never be overfilled with oil. This may lead to rapid overheating. For extreme slope operation, engine oil should be maintained at the full mark.

NOTE: Both ENGINE and POWER TRAIN fluid levels should be checked on level ground before working sidehills and slopes.

- Implements hitched to the drawbar — This may decrease weight on uphill track, e.g., logging arch, two-wheel wagon.
- Height of hitch on tractor — When a high drawbar is used the tractor is less stable than with the standard drawbar.
- Width of shoes — Wide track shoes tend to decrease “digging in”, hence tractor is more stable.
- Operated equipment — Be aware of the stability and other performance features of the equipment operated by the tractor.
- Keep all attachments or pulled loads low to the ground for optimum stability.

NOTE: Safe operation on steep slopes may require special machine maintenance as well as excellent operator skill and proper equipment for the specific application. Consult Operation & Maintenance Manual (if applicable) for proper fluid level requirements.

Features:

- **The standard demand cooling fan** provides improved fuel efficiency and increased horsepower.
- **Industry leading sealed and pressurized cab option** provides a cleaner and quieter operating environment with excellent Work Tool visibility on D and D2 Series machines.
- **Ergonomically designed cab** provides maximum operator comfort and visibility.
- **Low-effort joystick controls, armrest and retractable seat belt** for easy operation.
- **Available high-back, heated, air ride seat with seat mounted adjustable joystick controls** make the D and D2 Series machines the industry leaders in operator comfort.
- **Deep skid resistant steps** and two tilt cylinders makes egress/ingress easy.
- **Hand and foot throttle** for continuous or variable engine speed.
- **Anti-stall feature (B3 Series) and Electronic Torque Management (D and D2 Series)** provide maximum rimpull and hydraulic power while lugging the engine.
- **High hydraulic horsepower** gets work done quickly.
- **Direct drive hystat pumps** eliminate drive belts.
- **Ground level access** to all daily service and routine maintenance points helps reduce machine downtime for greater productivity.
- **High performance power train** provides maximum performance and production capability on D and D2 Series machines through the Electronic Torque Management system, optional two speed travel and an electronic hand/foot throttle with decel pedal capability.
- **Cat® “Intelligent Leveling” system (ILEV)** provides industry leading technology, integration and optional features on D and D2 Series machines such as dual direction self level, work tool return to dig and work tool positioner.
- **Speed Sensitive Ride Control** option on D and D2 Series machines improves operation on rough terrain, enabling better load retention, increased productivity and greater operator comfort.
- **Maximize machine capability and control with optional Advanced Display** providing on-screen adjustment capability on D and D2 Series machines for implement response, hystat response, and creep control, multi-language functionality with customizable layouts, security system, and rearview camera.
- **High performance cooling systems and extended life coolant**, along with high performance engine and hydraulic oils, extend service intervals for low operating costs.
- **Deutsch electrical connectors** are color coded, numbered and protected with nylon braiding.
- **Electro-deposited** or “E” coat corrosion protection for long paint life.
- **High flow XPS hydraulics** are optional on most D Series models. The XHP hydraulic package option on the 272D2, 297D2 and 299D2 combines the high pressure of XPS with even higher flow for the most demanding hydromechanical work tool applications such as mulching, cold planing, and wheel saw cutting.
- **High flow hydraulics** on the 226B3, 226D, 232D, 236D, 239D, 242D, 249D, 257D, and 259D operate more demanding, rotating work tools such as brooms, cold planers, trenchers, landscape rakes, power rakes, tillers, snow blowers, brush cutters, and stump grinders.

 C^ – Compatible but Lift Restrictions Apply and Maximum Machine Counterweights Required.
 D – European Union Restrictions Apply; Refer to Operation Maintenance Manual, "Safety Section: Worktools: Demolition."
 X – Not Compatible.

MODEL	239D		249D		259D	
Flywheel Power:						
Gross (SAE J1995)	50.1 kW	67.1 hp	50.1 kW	67.1 hp	55.4 kW	74.3 hp
